National Immunization Survey-Child

A User's Guide for the 2017 Public-Use Data File

Centers for Disease Control and Prevention

National Center for Immunization and Respiratory Diseases

Presented by:

NORC at the University of Chicago

October 2018

Acknowledgments

The development and production of the NIS-Child public-use data files is a team effort that has included contributions from many individuals (listed in alphabetical order) in the two organizations:

National Center for Immunization and Respiratory Diseases, CDC – Laurie D. Elam-Evans, Holly A. Hill, James A. Singleton, Chalanda S. Smith, Larry Wilkinson, and Zhen Zhao.

NORC at the University of Chicago – Rachel Bavley, Benjamin Skalland, Xian Tao, and Kirk Wolter.

The Data User's Guide uses **bold** font to highlight substantive changes in the methodology or study design from the previous year's Guide.

This page intentionally blank.

1. Introduction

In 1992, the Childhood Immunization Initiative (CII) (CDC 1994) was established to 1) improve the delivery of vaccines to children; 2) reduce the cost of childhood vaccines; 3) enhance awareness, partnerships, and community participation; 4) improve vaccinations and their use; and 5) monitor vaccination coverage and occurrences of disease. Subsequently, the Healthy People 2020 objectives established a target of having at least 90% of 2-year-old children fully vaccinated with most recommended vaccines (targets are 85% for HepA and the birth dose of HepB, and 80% for rotavirus) and 80% of 2-year-old children vaccinated with the basic immunization series. To fulfill the CII mandate of monitoring vaccination coverage and marking progress toward achieving those objectives, the National Immunization Survey - Child (NIS-Child) was implemented by the National Center for Immunization and Respiratory Diseases (NCIRD) and the National Center for Health Statistics (NCHS) of the Centers for Disease Control and Prevention (CDC) in 1994. From 1994 to 2014, the NIS-Child was conducted jointly by NCIRD and NCHS; since 2015, the NIS-Child has been conducted by NCIRD with assistance from NCHS.

The target population for the NIS-Child is non-institutionalized children aged 19 through 35 months living in United States households at the time of the interview. The official coverage estimates reported from the NIS-Child are proportions of children up-to-date with respect to the requisite numbers of doses of all routinely recommended vaccines for this age group (Robinson et al. 2017). These vaccines and their recommended numbers of doses are:

- diphtheria and tetanus toxoids and acellular pertussis vaccine adsorbed, diphtheria and tetanus toxoids and pertussis vaccine, or diphtheria and tetanus toxoids adsorbed (DTaP/DTP/DT) – 4 doses;
- poliovirus vaccine (polio) – 3 doses;
- measles, mumps, and rubella vaccine (MMR) – 1 dose;

- *Haemophilus influenzae* type b conjugate vaccine (Hib) – 3 or 4 doses depending on product type;
- hepatitis B vaccine (Hep B) – 3 doses;
- varicella (chicken pox) vaccine (varicella) – 1 dose;
- pneumococcal conjugate vaccine (PCV) – 4 doses;
- hepatitis A vaccine (Hep A) – 2 doses;
- influenza vaccine; (For the recommended number of doses of influenza vaccine and other vaccines, see http://www.cdc.gov/vaccines/hcp/acip-recs/vacc-specific/index.html.)
- rotavirus vaccine (RV) – 2 or 3 doses depending on product type.

In addition to these vaccines, interest focuses on the combined vaccine series 4:3:1:3*:3:1:4 (4+ DTaP/DTP/DT; 3+ polio; 1+ measles-containing vaccine (MCV); full series Hib, i.e., 3 or 4 doses depending on type of vaccine received; 3+ Hep B; 1+ varicella at or after 12 months of age; and 4+ PCV).

The NIS-Child collects data on each of these vaccines. Varicella vaccine was added in Quarter 3, 1996, pneumococcal conjugate vaccine in Quarter 4, 2000, influenza vaccine and hepatitis A vaccine in Quarter 1, 2003, and rotavirus vaccine in Quarter 3, 2007. The remainder of the vaccines have been included in the NIS-Child from its start in 1994. Information about current and past recommendations for each vaccine can be found at https://www.cdc.gov/vaccines/hcp/acip-recs/index.html.

The NIS-Child uses random digit dialing (RDD) telephone survey methodology to identify households containing children in the target age range, and interviews are conducted with the adult who is most knowledgeable about the child's vaccinations. With consent of the child's parent or guardian, the NIS-Child also contacts (by mail) the child's health care provider(s) to request information on vaccinations from the child's medical records. Since 2005, NIS-Child sampling, data collection, and weighting operations have been conducted by NORC at the University of Chicago.

Samples of telephone numbers are drawn independently, for each calendar quarter, within selected geographical areas, or strata. In 2017, there are 60 geographic strata for which vaccination coverage levels can be estimated (see Table F.1), including 8 local areas; the remaining 52 estimation areas are either an entire state, the District of Columbia, a territory (Guam), or a "rest of state" area. For states with "rest of state" or local estimation areas, estimates for the whole-state area can be produced as well. This design makes it possible to produce annual estimates of vaccination coverage levels for each state or territory, each "rest of state" area, the District of Columbia, and for each of the 8 local estimation areas with a specified degree of precision (a coefficient of variation of approximately 7.5%). Further, by using the same data collection methodology and survey instruments in all estimation areas, the NIS-Child produces comparable vaccination coverage levels among estimation areas and over time.

When the NIS-Child was established in 1994, 78 areas were chosen for sampling strata, including the 50 states, 6 urban areas that receive federal Section 317 immunization grants (Bexar County, TX; Chicago, IL; District of Columbia; Houston, TX; New York City, NY; Philadelphia County, PA), and 22 other urban areas. These areas were called "Immunization Action Plan" (IAP) areas in reference to plans developed to improve vaccination coverage following the resurgence of measles during 1989-1991. In 2005 and 2006, selected non-awardee IAP areas – areas that do not receive separate Section 317 funds – were "rotated off" (i.e., sample design no longer ensured adequate sample size to produce estimates for the area), and replaced by new areas "rotated on" (i.e., sample design ensured adequate sample size to produce estimates for the area). Starting in 2007, the base NIS-Child geographic strata included 56 areas (6 awardee urban areas and 50 state or "rest of state" areas). In addition, starting in 2007, state immunization programs could choose city/county areas of interest to have sample design that ensured adequate sample size to produce estimates for the area, using their Section 317 funds. **In 2017, four additional area were chosen: El Paso County, TX; Dallas County, TX; Travis County, TX; and Guam.** As noted throughout this report, several of the sampling, data collection, and estimation procedures differed for Guam when compared to the rest of the United States.

The 60 = 56 + 3 + 1 (territory) areas are called *estimation areas*. Table 10 in Section 8 shows a cross-walk of estimation areas between years.

Data for Guam are not included in the 2017 public-use data file to protect respondent confidentiality, as the sampling fractions were large in this small-population area. Interested researchers can access data for Guam by submitting a proposal and working through the NCHS Research Data Center. The link and guidelines for developing a proposal are located at the following URL: www.cdc.gov/rdc. **Data for the U.S. Virgin Islands and Puerto Rico are not available for 2017 as data collection in these areas was suspended due to Hurricane Maria.**

To maintain consistency with past NIS-Child public-use data files, or PUFs, variable names and descriptions continue to use the term "IAP" to designate areas included as strata, which was the term used prior to 2008. The changing geographic strata over time will not cause a problem with bias in estimation of state and national coverage levels since the geographic strata are nested within state.

In 2017, the NIS-Child utilized a dual-frame sampling design with independent samples drawn from landline and cell-phone sampling frames. The cell-phone component was added to the survey in 2011 in order to address the rapid rise of cell-phone-only households. **Preliminary results from the July-December 2017 National Health Interview Survey (NHIS) indicate that the number of households with only cell phones continues to increase. Approximately 61.8% of all children under 18 years of age—over 45 million children—live in households with access to only wireless telephones (Blumberg and Luke 2018).** Several of the sampling, data collection, and estimation procedures differ for the cell-phone sample as compared to the landline sample, as noted throughout this report.

For the 2017 NIS-Child landline sample, the household interviews began on January 7, 2017 and ended on January 22, 2018. For the 2017 NIS-Child cell-phone sample, the household interviews began on January 5, 2017 and ended on January 26, 2018. Provider data collection extended from February 2017 to April 2018 for both sample sources. A total sample (including sample from

Guam) of approximately 25.2 million telephone numbers (7.9 million landline and 17.3 million cell-phone) yielded household interviews for 28,905 children (2,364 landline and 26,541 cell-phone), 15,599 of whom (1,362 landline and 14,237 cell-phone) had adequate provider data (provider-reported vaccination data adequate to determine whether the child was up-to-date with respect to the recommended immunization schedule). The 2017 NIS-Child public-use data file (which does not include data for Guam) contains data for 28,465 children with completed household interviews, and more extensive data (e.g. provider-reported vaccinations and facility data) for 15,333 children with adequate provider data (including 290 unvaccinated children). Data were collected in Guam in 2017, although children in this area are not included on the public-use data file in order to protect confidentiality. Data for the U.S. Virgin Islands and Puerto Rico are also not included on the 2017 public-use data file as data collection in these areas was suspended due to Hurricane Maria.

In 2012, to reduce the length of the household interview, decrease respondent burden, and potentially improve response rates, the NIS-Child household questionnaire was modified. Official NIS-Child vaccination coverage estimates are based on the provider-reported vaccination histories for each child. Among children with data received from vaccination providers identified in the household interview, it must be determined which children have "adequate provider data," that is, which children have provider data adequate to determine whether the child is up to date with respect to the recommended immunization schedule. Beginning in 2012, questions that were previously used to define adequate provider data were no longer available. With this questionnaire change, it was no longer possible to use the same definition of adequate provider data as was used prior to 2012, and so beginning in 2012 all children with any provider-reported vaccination data are considered to have adequate provider data. See the user's guide for the 2014 NIS-Child public-use data file (NCHS 2015a) for more detail about this change and its impact.

The weights included in this public-use data file afford the data analyst the capability of conducting several different types of analyses, depending on interests and aims. One can choose to analyze all children with completed household interviews or only the subset of children for whom the provider-

reported data are adequate. Previous NIS-Child public-use data files have also provided analysts with these capabilities.

The 2017 NIS-Child public-use data file includes only dual-frame weights. Dual-frame estimates are the best estimates for the NIS-Child in terms of minimizing any bias due to the incompleteness of the landline sampling frame. Section 6 of this user's guide provides information about the creation of the weight variables included in the 2017 NIS-Child public-use data file, and Section 8 provides guidance for their use.

Vaccination coverage estimates for 2017 are available on the *ChildVaxView* website, https://www.cdc.gov/vaccines/imz-managers/coverage/childvaxview/index.html. An article summarizing key findings from the NIS-Child data, as published in the *Morbidity and Mortality Weekly Report (MMWR),* will also be available on this website. The accompanying codebook (NCIRD 2018) documents the contents of the 2017 NIS-Child public-use data file. For reference, Appendix E (Alphabetical Listing of Variables in the 2004-2017 Public-Use Data Files) provides a full list of variables in the 2017 and previous NIS-Child public-use data files.

Additional information on the NIS-Child is available at: http://www.cdc.gov/vaccines/imz-managers/nis/about.html.

For additional information on the NIS-Child public-use data file, please contact the NCIRD Information Dissemination Staff:

2. Sample Design

The NIS-Child uses two phases of data collection to obtain vaccination information for a large national probability sample of young children: an RDD telephone survey designed to identify households with children 19 through 35 months of age, followed by the Provider Record Check, a mailed survey to children's vaccination providers. This section summarizes these two phases of data collection. Other descriptions of the sample design are given by Ezzati-Rice et al. (1995), Zell et al. (2000), Smith et al. (2001a, 2005), and Wolter et al. (2017a).

2.1. The NIS-Child RDD Telephone Survey

The NIS-Child RDD telephone survey phase uses independent, quarterly samples of telephone numbers. Sampling frames were provided by Marketing Systems Group (MSG). Landline telephone and cell-phone numbers were sampled within estimation areas in each quarter of 2017. Table F.1 (in Appendix F) lists the estimation areas for the 2017 NIS-Child by state and shows the estimated number of children living in each state and estimation area in 2017.

The NIS-Child uses the list-assisted method of RDD (Lepkowski 1988) to sample landline telephone numbers. This method selects a random sample of telephone numbers from "banks" of 100 consecutive telephone numbers (e.g., 773-256-0000 to 773-256-0099) that contain at least one directory-listed residential telephone number. Because directory listings are not available for cell phones, the NIS-Child cell-phone sample did not use the list-assisted method of RDD, but rather used RDD without list-assistance. That is, the cell-phone sample was selected from all banks of cell-phone numbers, not just those containing at least one directory-listed residential telephone number. Directory listings were also unavailable for landline sample in Guam, so the landline and cell-phone samples for this area were selected without list-assistance using simple random sampling.

The target sample size of completed telephone interviews in each estimation area is designed to achieve an approximately equal coefficient of variation of 7.5% for an estimator of vaccination coverage derived

from provider-reported vaccination histories, given a true coverage parameter of 50%. Landline telephone and cell-phone sample sizes were chosen such that the two samples combined meet the target coefficient of variation of 7.5%.

In 2017, including Guam sample, 54.0% of children (57.6% of landline sample children and 53.6% of cell-phone sample children) with a completed household interview were determined to have adequate provider data. Excluding Guam, this proportion was 53.9% (57.2% for the landline sample and 53.6% for the cell-phone sample). The percentage of children with adequate provider data varies among the non-territory estimation areas (from 42.7% in Dallas County, TX to 62.6% in Vermont). The phrase "adequate provider data" originally meant that sufficient vaccination history information was obtained from the provider(s) to determine whether the child is up-to-date with respect to the recommended vaccination schedule. Starting with the 2002 NIS-Child public-use data file, the definition of children with adequate provider data was expanded to include unvaccinated children. These are children for whom either (1) the respondent reported during the household interview that the child had received no vaccinations and has no providers, or (2) the respondent reported during the household interview that the child had received no vaccinations but has one or more providers, and those providers all reported administering no vaccinations. An NCHS Series 2 Report on the statistical methodology of the NIS-Child (Smith et al. 2005) includes details of how unvaccinated children are included in the estimates of vaccine coverage. This report can be viewed at http://www.cdc.gov/nchs/data/series/sr_02/sr02_138.pdf. This modification to the NIS-Child produces only small changes in vaccination coverage for estimation areas and states, because the number of unvaccinated children in the sample is very small (**only 293 in 2017**, including Guam). As described in the introduction, the definition of adequate provider data was modified in 2012 to include all children with provider-reported vaccination data, plus unvaccinated children.

The design and implementation of the NIS-Child landline sample involves four procedures. First, statistical models predict the number of sample telephone numbers needed in each estimation area to meet

the target precision requirements. Second, the sample for an estimation area is divided into random sub-samples called replicates. By releasing replicates as needed, it is possible to spread the interviews for each sampling area evenly across the entire calendar quarter. Third, an automated procedure eliminates a portion of the non-working and non-residential telephone numbers, plus numbers on the NIS do-not-call list, from the sample before the interviewers dial them. Fourth, the sample telephone numbers are matched against a national database of residential telephone numbers in order to obtain usable mailing addresses for as many sample households as possible. To promote participation in the NIS-Child, an advance letter is sent to these addresses approximately two weeks prior to calling to conduct the household interview.

The design and implementation of the cell-phone sample differs from that of the landline sample in two ways:

- Prior to 2014, there was no process to remove non-working and non-residential cell-phone numbers before dialing them. Beginning in 2014 and 2015, an automated process was implemented to remove cell-phone numbers flagged as having no recent activity and that were therefore very likely to be non-working cell phones. In 2016, a different automated process found to be more efficient in removing non-working cell-phone numbers was used. **Following a July 2016 Federal Communications Commission (FCC) declaratory ruling (FCC 16-72, CG Docket No. 02-278) stating that the federal government and contractors working on behalf of the federal government are not subject to the restrictions on cell-phone dialing in the Telephone Consumer Protection Act of 1991 (TCPA, 47 U.S.C. 227), the NIS transitioned from manual dialing of cell phones to auto-dialing cell phones in November 2016. After this transition, the automated process to remove non-working cell-phone numbers was no longer cost effective, and beginning in 2017 this process was no longer used in the cell-phone sample.**

- Cell-phone numbers were not matched to an external database to obtain mailing addresses. Cell-phone sample cases were not sent advance letters.

2.2. The NIS-Child Provider Record Check

At the end of the household interview, consent to contact the child's vaccination provider(s) is requested from the parent/guardian. When oral consent is obtained, each provider is mailed an immunization history questionnaire. This mail survey portion of the NIS-Child is the Provider Record Check (PRC). The Provider Record Check is conducted in the same manner for both landline and cell-phone sample cases.

The instructions ask vaccination providers to mail or fax the immunization history questionnaire back upon completion. Two weeks after the initial mailing, a telephone call is made to providers who have still not responded, to remind and encourage them to complete the form and either mail or fax the information back. In some instances, provider-reported vaccination histories are completed over the telephone. The data from the questionnaires are edited, entered, cleaned, and merged with the household information from the RDD survey to produce a child-level record.

2.3. Summary of Data Collection

Table 1 presents selected operational results of NIS-Child data collection for calendar year 2017. To facilitate comparisons with prior years, the numbers in Table 1 are presented separately for the landline and cell-phone samples, and exclude the U.S. territory samples. **Children aged 19 through 35 months during 2017 data collection were born between January 2014 and May 2016.**

The landline RDD sample (in replicates that were released for use) consisted of 7,699,528 telephone numbers. Of those, 4,622,931 were eliminated before release to the telephone centers by the automated procedure as non-working numbers, non-residential numbers, or numbers on the NIS do-not-call list. The remaining 3,076,597 numbers were sent to the telephone centers to be dialed, and 348,222 households were identified, as shown in Rows C and F. Among the identified

households, 293,907 (84.4%) were successfully screened. Of these, 2,857 (1.0%) contained one or more age-eligible children. Among these households, 2,174 (76.1%) completed the household interview.

The cell-phone sample (in replicates that were released for use) consisted of 17,183,133 telephone numbers. Of those, 31,396 were eliminated before release to the telephone centers as numbers on the NIS do-not-call list. The remaining 17,151,737 numbers were sent to the telephone centers to be dialed, and 1,383,595 active personal cell-phone numbers (APCNs) were identified, as shown in Row F. Among the identified APCNs, 1,158,106 (83.7%) were successfully screened. Of these, 36,481 (3.2%) were deemed eligible for the NIS-Child interview. Among the identified eligible respondents, 25,343 (69.5%) completed the interview.

A standard approach for measuring response rates in telephone surveys has been defined by the Council of American Survey Research Organizations (CASRO 1982). The CASRO response rate is equivalent to "RR3" of AAPOR Standard Definitions (AAPOR 2016). **In 2017, the CASRO response rate (Row J, Table 1) for the landline sample was 51.9%. The CASRO response rate equals the product of the resolution rate (80.8%, Row E), the screening completion rate (84.4%, Row G), and the interview completion rate among eligible households (76.1%, Row I).** The resolution rate is the percentage of the total telephone numbers selected that are classifiable as non-working, non-residential, or residential. The screening completion rate is the percentage of known households that are successfully screened for the presence of age-eligible children. The interview completion rate is the percentage of households with one or more age-eligible children who complete the household interview.

The CASRO response rate (Row J) for the cell-phone sample in 2017 was 25.0%. As with the landline sample, it equals the product of the resolution rate (43.0%, Row E), the screening completion rate (83.7%, Row G), and the interview completion rate among eligible households (69.5%, Row I).

The CASRO response rate (Row J) for the combined landline and cell-phone sample was 26.1% in 2017. See footnote 6 of Table 1 for a description of the calculation of the combined CASRO response rate.

Row K of Table 1 shows that household interviews were completed on behalf of 2,235 age-eligible children in the landline sample and 26,230 children in the cell-phone sample. Rows L through O give results for the Provider Record Check phase. Specifically, Row L gives the rate of obtaining oral consent from household respondents to contact their children's vaccination providers – 64.2% for landline sample cases and 62.7% for cell-phone sample cases in 2017.

The number of immunization history questionnaires mailed to vaccination providers exceeds the number of completed interviews for children with consent because some children have more than one vaccination provider. **Of the questionnaires mailed to providers of children from the landline sample, 1,658 (95.2%, Row N) were returned. Among the children with completed household interviews, 1,279 (57.2%, Row O) had adequate vaccination histories based on provider reporting (1,261) or were determined to be unvaccinated (18). The other 42.8% of children lacked adequate provider data for a variety of reasons, such as the parent did not give consent to contact the child's provider(s), the provider(s) did not have records for the child, or the provider(s) did not report the vaccination history.**

Of the questionnaires mailed to providers of children from the cell-phone sample, 18,910 (93.9%, Row N) were returned. Among the cell-phone sample children with completed household interviews, 14,054 (53.6%, Row O) had adequate vaccination histories based on provider reporting (13,782) or had no vaccinations based on household reporting (272). The other 46.4% of children lacked adequate provider data for a variety of reasons, such as the parent did not give consent to contact the child's provider(s), or the provider(s) did not have medical records for the child.

In 2017, data from the Health Insurance Module (HIM) were collected. Among the 2,235 children in the landline sample with completed household interviews, 1,489 (66.6%, Row P) completed the HIM. Among the 26,230 children in the cell-phone sample with completed household interviews, 16,955 (64.6%, Row P) completed the HIM.

For each estimation area and each state, Table F.1 (see Appendix F) shows the number of children with completed household interviews and the number of children with adequate provider data.

Table 1: Selected Operational Results of Q1/2017-Q4/2017 NIS-Child Data Collection (Excluding U.S. Territories)

Row	Key Indicator	Landline Sample		Cell-Phone Sample		Combined Samples		Formula
		Number	Percent	Number	Percent	Number	Percent	
	Household Phase							
A	Total Selected Telephone Numbers in Released Replicates	7,699,528	--	17,183,133	--	24,882,661		--
B	Phone Numbers Resolved before Computer-Assisted Telephone Interviewing	4,622,931	60.0%	31,396	0.2%	4,654,327	18.7%	B/A
C	Total Phone Numbers Released to Telephone Centers	3,076,597	--	17,151,737	--	20,228,334		A-B
D	Advance Letters Mailed	1,084,034	35.2%	0	0.0%	1,084,034	5.4%	D/C
E	Resolved Phone Numbers[1] – *Resolution Rate*	6,222,213	80.8%	7,387,566	43.0%	13,609,779	54.7%	E/A
F	Households Identified – *WRN/APCN Rate*[2]	348,222	5.6%	1,383,595	18.7%	1,731,817	12.7%	F/E
G	Households Successfully Screened[3] – *Screener Completion Rate*	293,907	84.4%	1,158,106	83.7%	1,452,013	83.8%	G/F
H	Eligible Households – *Eligibility Rate*[4]	2,857	1.0%	36,481	3.2%	39,338	2.7%	H/G
I	Households with Completed Household Interviews – *Interview Completion Rate*	2,174	76.1%	25,343	69.5%	27,517	70.0%	I/H
J	CASRO Response Rate[5]	--	51.9%	--	25.0%		26.1%	E*G*I[6]
K	Age-Eligible Children with Completed Household Interviews[7]	2,235	--	26,230	--	28,465		--
	Provider Phase							
L	Children with Consent to Contact Vaccination Providers	1,435	64.2%	16,455	62.7%	17,890	62.8%	L/K
M	Immunization History Questionnaires Mailed to Providers	1,742	--	20,132	--	21,874		--
N	Immunization History Questionnaires Returned from Providers	1,658	95.2%	18,910	93.9%	20,568	94.0%	N/M
O	Children with Adequate Provider Data	1,279 (includes 18 unvaccinated children)	57.2%	14,054 (includes 272 unvaccinated children)	53.6%	15,333 (includes 290 unvaccinated children)	53.9%	O/K
	Modules							
P	Age-Eligible Children with Completed Household Interview and Completed Health Insurance Module	1,489	66.6%	16,955	64.6%	18,444	64.8%	P/K

[1] Includes phone numbers resolved before CATI (Row 2).

[2] For the landline sample, this is the working residential number (WRN) rate; for the cell-phone sample, it is the active personal cell-phone number (APCN) rate.

[3] For the landline sample, this is the age-eligibility screener; for the cell-phone sample, it is a combination of the screener for non-minor-only cell phone status and the age-eligibility screener.

[4] For the landline sample, this is the age-eligibility rate; for the cell-phone sample, it reflects a combination of the non-minor-only cell-phone rate and the age-eligibility rate.

[5] CASRO, Council of American Survey Research Organizations.

[6] The response rate is the number of households with a completed household interview divided by the estimated number of eligible households in the sample. Within each sample type (landline or cell phone), the number of eligible households was estimated using the CASRO assumptions; these assumptions are that the rate of households among the unresolved telephone numbers is the same as the observed rate of households among the resolved telephone numbers, and the rate of eligible households among unscreened households is the same as the observed rate of eligible households among screened households. Under these assumptions, within each sample type the CASRO response rate is equal to the product of the resolution rate, the screener completion rate, and the interview completion rate. For the combined samples, we have defined the CASRO response rate as the total number of households with a completed interview divided by the estimated total number of eligible households across both sample types, where the estimated total number of eligible households is equal to the sum of the estimated number of eligible households in the landline sample (using CASRO assumptions) and the estimated number of eligible households in the cell-phone sample (using CASRO assumptions).

[7] Rows K-P reflect the removal of children with an ineligible best date of birth.

2.4. Informed Consent, Security, and Confidentiality of Information

The advance letter, introduction to the telephone survey, and oral consent assure the respondent of the confidentiality of his/her responses and the voluntary nature of the survey. Informed consent is obtained from the person in the household most knowledgeable about the eligible child's vaccination history (generally the parent or guardian of the child). Informed consent to contact the child's vaccination provider(s) is obtained at the end of the interview.

Information in the NIS-Child is collected and processed under high security. To ensure privacy of the respondents and confidentiality of sensitive information, standards have been established for release of data from this survey. All CDC staff and contractor staff involved with the NIS-Child sign confidentiality agreements and follow instructions to prevent disclosure.

All information in the NIS-Child is collected under strict confidentiality and can be used only for research [Section 308(d) of the Public Health Service Act, 42 U.S. Code 242m(d) and the Privacy Act of 1974 (5 U.S. Code 552a)]. Prior to public release, the contents of the public-use data file go through extensive review by the NCHS Disclosure Review Board to protect participant privacy as well as data confidentiality.

3. Content of NIS-Child Questionnaires

This section describes the questionnaires used in the 2017 NIS-Child telephone interview of households and in the NIS-Child Provider Record Check.

3.1. Content of the Household Questionnaire

The computer-assisted telephone interview (CATI) questionnaire used in the RDD phase of NIS-Child data collection consists of two parts: a screener to identify households with children aged 19 through 35 months and an interview portion. The questionnaire is modeled on the Immunization Supplement to the National Health Interview Survey (NHIS) (NCHS 1999). The NIS-Child CATI questionnaire has been translated into Spanish, and LanguageLine Solutions® (formerly part of AT&T) is used for real-time translation into many other languages (Wall et al. 1995). Table 2 summarizes the content of each section of the NIS-Child household interview. The CATI questionnaire is available at http://www.cdc.gov/vaccines/imz-managers/nis/datasets.html.

In the screener, the purpose of the survey is explained to the respondent, and the household is screened to determine whether it contains any children aged 19 through 35 months (any child who was or would be aged 19 through 35 months during the calendar quarter is eligible). If the household has an eligible child, the respondent is asked whether he/she is the most knowledgeable person for the child's vaccination history. If the respondent indicates that another person in the household is more knowledgeable, the interviewer asks to speak to him/her at that time. If that person is unavailable to be interviewed, the interview proceeds to Section MR, the name of the most knowledgeable person is recorded, and a "callback" is scheduled for a later date. For the cell-phone sample, prior to screening for age-eligibility, the household is screened to ensure that the cell-phone is used by an adult (i.e., to ensure it is not a minor-only cell phone). If the household has more than one age-eligible child, data are collected for each eligible child.

Table 2: Content of the Household Interview, National Immunization Survey - Child, 2017

Questionnaire Section	Content of Section
Section S	Screening questions to determine NIS-Child eligibility
Section MR	Most-knowledgeable-respondent callback questions
Section B	Ever vaccinated and influenza vaccination questions
Section C	Demographic and socioeconomic questions
Section D	Provider information and request for consent to contact the eligible child's vaccination provider(s)
Section E	Health Insurance Module (HIM)

Prior to Q1/2012, the person being interviewed was asked during the screener section whether he/she had a written record (shot card) of the child's vaccination history and whether it was easily accessible. If a shot card was available, the respondent was asked to provide information directly from it in Section A (which asked respondents with shot cards about the shots on the card). However, beginning in Q1/2012, Section A and most of Section B were eliminated from the regular questionnaire, and therefore all interviews proceeded directly to a reduced form of Section B, which asks the respondent to recall information about the child's influenza vaccinations. In 2015 and 2016, Section A was reinstated for Guam respondents, but was not administered to any respondents in 2017.

Section C obtains information that includes relationship of respondent to the child, race and Hispanic origin of the child, household income, educational attainment of the mother, and other information on the socioeconomic characteristics of the household and its eligible children.

In Section D of the NIS-Child household interview, identifying information (such as name, address, and telephone number) for the child's vaccination provider(s) is requested, as well as the full names of the child(ren) and the respondent, so that NIS-Child personnel can contact the provider(s) and identify the child(ren) whose immunization information the NIS-Child is requesting. After this information is obtained, consent to contact the child's vaccination provider(s) is requested. When oral consent and

sufficient identifying information are obtained, the immunization history questionnaire is mailed to the child's vaccination provider(s).

Beginning in 2006, a Health Insurance Module (HIM) was administered upon completion of Section D to collect data regarding the types of medical insurance coverage the child has had since birth. If a respondent provided consent to contact medical providers and completed Section D, he/she flowed directly into the HIM. If, however, consent or any other critical provider question was refused, the call was terminated; only upon callback on which consent was granted or a second refusal given within Section D was the respondent asked the HIM.

Some changes were made to the NIS-Child questionnaire during 2017. These are listed below.

- **Year references for income questions were updated to refer to the previous year, 2016. That is, the question text at CFAMINC, C13_DON'T_KNOW, and C13_REFUSED was updated to ask about 2016 income rather than 2015.**

- **While one set of questions about influenza vaccinations are asked in Section B throughout the year, additional questions are asked only between April and June and often change year to year; the influenza question responses are not included on the PUF, so the PUF contents are not affected by these changes.**

- **Guam respondents with shot records were administered Section B instead of Section A, and questions about the availability of shot records were removed. Guam respondents also began to be asked about Medicaid coverage. These changes do not affect the PUF as Guam respondents are not included on the 2017 PUF in order to protect respondent confidentially.**

3.2. Content of the Immunization History Questionnaire (IHQ)

The immunization history questionnaire mailed to the vaccination providers is designed to be simple and brief, to minimize provider burden and encourage survey participation. The structure and content of this

form were initially derived from the National Immunization Provider Record Check Study (NHIS/NIPRCS), which collected and reconciled vaccination data from the providers of respondents to the Immunization Supplement to the National Health Interview Survey. The immunization history questionnaire consists of two double-sided pages. Page 1 includes space for a label that gives the child's name, date of birth, and sex . The remainder of page 1 contains questions about the facility and vaccination provider. Page 2 gives instructions for filling out the shot grid, which appears on page 3. Page 4 thanks the vaccination provider for providing the information, and lists websites and telephone numbers that can be used to obtain more information about the NIS-Child and the NCIRD. The Immunization History Questionnaire is available at http://www.cdc.gov/vaccines/imz-managers/nis/datasets.html.

In Q4/2017, the IHQ was modified to remove Question 5b, which asks if the practice has been deputized to administer Vaccines for Children vaccines to underinsured children. This change does not affect the contents of the PUF.

4. Data Preparation and Processing Procedures

The household and provider data collection in the NIS-Child incorporate extensive data preparation and processing procedures. During the household interview, the CATI system supports reconciliation of critical errors as interviewers enter the data. After completion of interviewing for a quarter, post-CATI editing and data cleaning produce a final interview data file. The editing of the provider data begins with a manual review of returned immunization history questionnaires, data entry of the questionnaires, and cleaning of the provider data file. After the provider data are merged with the household interview data and responses from multiple providers for a child are consolidated into a child-level data record, the editing continues. A quality assurance check is performed based on the name, sex, and date-of-birth information from all sources to ensure that the provider completed the questionnaire for the correct child and to confirm age-eligibility. Editing of the provider-reported vaccination dates then attempts to resolve specific types of discrepancies in the provider data. The end product is an analytic file containing household and provider data for use in estimating vaccination coverage.

4.1. Data Preparation

The editing and cleaning of NIS-Child data involve several steps. First, the CATI system enables interviewers to reconcile potential errors while the respondent is on the telephone. Further cleaning and editing take place in a post-CATI clean-up stage, involving an extensive review of data values, cross tabulations, and the recoding of verbatim responses for race and ethnicity. The next step involves the creation of numerous composite variables. Provider data are cleaned in a separate step. After these steps have been completed, imputations are performed for item non-response on selected variables, and weights are calculated. The procedures and rules of the National Health Interview Survey serve as the standard in all stages of data editing and cleaning (http://www.cdc.gov/nchs/nhis.htm).

4.1.1. Editing in the CATI System

The CATI software checks consistency across data elements and does not allow interviewers to enter invalid values. Catching potential errors early increases the efficiency of post-survey data cleaning and processing.

To prevent an overly complicated CATI system, out-of-range and inconsistent responses produce a warning screen, allowing the interviewer to correct real time errors. This allows the interviewer to reconcile errors while respondent is on the telephone. CATI warning screens focus on items critical to the survey, such as those that determine a child's eligibility (e.g., date of birth).

A CATI system cannot simultaneously incorporate every possible type of error check and maximize system performance. To reconcile this trade-off, post-CATI edits are used to resolve problems that do not require access to the respondent, as well as unanticipated logic problems that appear in the data.

4.1.2. Post-CATI Edits

The post-CATI editing process produces final, cleaned data files for each quarter. The steps in this process, implemented after all data collection activities for a quarter are completed, are described below.

Initial Post-CATI Edits and File Creation

After completion of interviewing each quarter, the raw data are extracted from the CATI data system and used to create two files: the sample file and the interview data file. The sample file contains one record for each sample telephone number and summary information for telephone numbers and households. The interview data file contains one record for each eligible sampled child and all data reported for the child during the household survey.

Following creation of these two files, a preliminary analysis of each file identifies out-of-range values and extraneous codes. The first check verifies the eligibility status of children. Once the required corrections are verified, invalid values are replaced with either an appropriate data value or a missing value code.

Frequency Review

After the pre-programmed edits are run, frequency distributions of all variables in each file are produced and reviewed. Each variable's range of values is examined for any invalid values or unusual distributions. If blank values exist for a variable, they are checked to see whether they are allowable and whether they occur in excessive numbers. Any problems are investigated and corrected as appropriate.

File Crosschecks

Crosscheck programs ensure that cases exist across files in a consistent manner. Specifically, checks ensure that each case in the interview data file is also present in the sample file and that each case in the sample file was released to the telephone center. Checks also ensure that no duplicate households exist in the sample file and no duplicate children exist in the interview data file.

When all checks have been performed, the final quarterly interview data file is created. Programmers and statisticians then create composite variables constructed from basic variables for each child. Sampling weights (described in Section 6 of this Guide) are added to each record.

4.1.3. Editing of Provider Data

Six to eight weeks after the close of household data collection for a quarter, the majority of the immunization history questionnaires have been collected from providers. The data from the hard-copy questionnaires are entered and independently re-entered to provide 100% verification. The provider data file is cleaned, in a similar fashion to the household data file, for out-of-range values and consistency. A computer program back-codes "other shot" verbatim responses into the proper vaccine category (e.g., Engerix B counts as Hep B, and Tetramune counts as DTP and Hib). These translations come from a file that contains all such verbatim responses ever encountered in the NIS-Child. Also, the provider data file is checked for duplicate records, and exact duplicates are removed. If the provider data contain a date of birth, sex, or name for the child that differs from the household interview for that child, the questionnaire is re-examined to see whether it may have been filled out for the incorrect child. Provider data that appear to have been filled out for the wrong child are removed from the provider database. When a child has data

from multiple providers, decision rules are applied to produce the most complete picture of the child's vaccination history.

Once these data have been cleaned, they are combined with the household data file. Information from up to five providers can be added to a child's record. If more than one provider reported vaccination data for the child, the data from the multiple provider reports are combined into a single history for the child, called the "synthesized provider-reported vaccination history." The determination of whether the child is up-to-date for recommended vaccines and vaccine series is based on the child's synthesized provider-reported vaccination history.

Many variables in the household data file are checked against or verified with the provider data file. For example, a child's date of birth as recorded by the provider is checked against the date of birth as given by the household, to verify that the provider was reporting for that specific child and to form a "best" date of birth for the child. All children with at least one provider-reported vaccination are considered to have adequate provider data.

4.2. Limitations of Data Editing Procedures

Although data editing procedures were used for the NIS-Child, the data user should be aware that some inconsistent data might remain in the public-use data file. The variables that indicate whether a child is up-to-date on each vaccine or series (on which the estimates of vaccination coverage are based) are derived from provider-reported data, and the NIS-Child does not re-contact households or providers to attempt to reconcile potential discrepancies in provider-reported vaccination dates or to resolve date-of-birth reporting errors. However, beginning with the 1999 NIS-Child, the provider-reported data are manually reviewed and edited to correct specific reporting errors. The *National Immunization Survey: Guide to Quality Control Procedures* (CDC 2002) discusses the change in editing procedures in more detail. Some children with adequate provider data may have incomplete vaccination histories. These incomplete histories arise from three primary sources: 1) the household does not identify all vaccination

providers, 2) some but not all providers respond with vaccination data, and 3) all identified providers respond with vaccination data but fail to list all the vaccinations in the child's medical record. Even with these limitations, the NIS-Child overall is a rich source of data for assessment of up-to-date status and age-appropriate vaccination. Also, the NIS-Child is the only source to provide comparable provider-reported vaccination data across states and local areas in the United States.

4.3. Variable-Naming Conventions

The names of variables follow a systematic pattern as much as possible. The codebook for the public-use data file groups the variables into ten broad categories according to the source of the data (household or provider) and the content of the variable (NCIRD 2018). See Section 7 of this report for detailed information on the contents of the public-use data file.

4.4. Missing Value Codes

Missing value codes for each variable can be found in the codebook (NCIRD 2018). For household variables, the missing value codes usually are 77 for DON'T KNOW and 99 for REFUSED. Some household variables may also contain blanks, if the question was not asked. The variables developed from the immunization history questionnaire generally do not have specific missing value codes.

4.5. Imputation for Item Non-Response

The NIS-Child uses imputation primarily to replace missing values in the socioeconomic and demographic variables used in weighting. Missing values of these variables are imputed for all children with a completed household interview – i.e., all children appearing on the public-use data file. Missing values of health insurance variables are also imputed for children with adequate provider data. A sequential hot-deck method is used to assign imputed values (Ford 1983). Class variables are used to separate respondents into cells. Donors and recipients must agree on the categories of the class variables, which include the estimation area. Within the categories of the class variables, respondents are sorted by variables related to the variable to be imputed. The last case with an observed value is used as the donor

for up to four recipients. The "Notes" line for each variable in the codebook (NCIRD 2018) identifies variables that contain imputed values. These variables include the sex, Hispanic origin, race, health insurance status, and first-born status of the child; the education level, age group, marital status, and mobility status of the mother; and the income-to-poverty ratio of the household.

The count of vaccinations for a specific vaccine is based on the number of unique vaccination *dates* reported by the child's provider(s). In filling out the immunization history questionnaire a provider may not know the date of the first dose of hepatitis B, which is typically given at birth. The provider does, however, have the option of checking the "Given at Birth" box for the first dose of hepatitis B. If it was checked "yes" and the date of the birth dose of hepatitis B was not reported, a program assigns the date of the birth dose for this vaccine. A value is imputed from the distribution of provider-reported dates for the birth dose of hepatitis B. The birth dose for this imputation is defined as being given in the first 7 days of life--between the date of birth (i.e., 0 days) and the date of birth plus 6 days. This imputation procedure was first implemented for Quarter 1, 2000 – Quarter 4, 2000.

Table 3 shows the distribution of age in days at the birth dose of hepatitis B for children in 2017 with a provider-reported birth dose. A similar table is included in the 2000-2016 data user's guides. For 1997, 1998, and 1999, Section 5 of the data user's guide provides information on the distribution of age in days for the birth dose of hepatitis B vaccine and gives guidance on imputing age in days at birth dose for children with a missing date, but for whom the provider checked the box indicating that a dose was administered at birth (see HEP_BRTH).

Table 3: Distribution of Age (in Days) at the Birth Dose of Hepatitis B Vaccine, National Immunization Survey - Child, 2017

Age in Days at Birth Dose	Unweighted Percentage Of Birth Doses*
0	59.4
1	26.7
2	8.7
3	2.2
4	1.3
5	0.9
6+	0.8

* Excludes U.S. territories.

4.6. Vaccine-Specific Recoding of Verbatim Responses

On the IHQ, providers can list vaccinations in the "other" section of the IHQ shot grid. After data collection, they are reclassified into the listed categories, if possible, using a vaccination recoding table. This table is reviewed by NCIRD personnel to ensure the shots are recoded into the appropriate category or categories (for combination shots).

4.7. Composite Variables

A number of composite variables (constructed from basic variables) are created and included in the NIS-Child public-use data file. Composite variables assist users and data analysts by eliminating duplication of effort and making NIS-Child data easier to use.

Since the initial years of NIS-Child data collection, the household composite variables have included up-to-date status on individual vaccinations, race of child, household income, and up-to-date status on several vaccination series. Many of these household composite variables are included in the NIS-Child public-use data file. See Section 7 of this report for information on the key variables.

In Quarter 3, 1999, the NIS-Child race questions (see questions C3, C9 and C10 in the household questionnaire) were expanded to include Alaska Native, Native Hawaiian, and Pacific Islander, implementing the revised Office of Management and Budget (OMB) standards for classification of race and ethnicity (https://www.whitehouse.gov/wp-content/uploads/2017/11/Revisions-to-the-Standards-for-the-Classification-of-Federal-Data-on-Race-and-Ethnicity-October30-1997.pdf). The composite race variables in the 2002 through present NIS-Child public-use data files, however, contain only three categories: white alone; black alone; and all other races alone/multiple races. (The variable RACE_K classifies each child into one of these three categories, while the variable RACEETHK includes a separate "Hispanic" category.) The "all other races alone" category includes Asian, American Indian or Alaska Native, Native Hawaiian or Pacific Islander, and other races. If more than one race was selected during administration of the child race questions, the child is classified as multiple races. Because of small sample sizes and risk of disclosure within estimation areas, the 2002 through present NIS-Child public-use data files do not contain any variables with separate multiple-race categories. Rather, the children with multiple races are included in the "all other races" category. Table 4 shows some characteristics of the current race/ethnicity categories.

Table 4: Weighted Distribution of Children by Race/Ethnicity and Corresponding Combined Vaccine Series* (4:3:1:3*:3:1:4), Pneumococcal, and Varicella Vaccination Coverage Estimates, National Immunization Survey - Child, 2017

Race/Ethnicity Classification	Weighted Distribution of Children aged 19-35 Months in U.S. Estimate (%)	Weighted Percentage 4:3:1:3*:3:1:4 UTD Estimate (%) (Standard Error (%))	Weighted Percentage 4+ Pneumococcal Estimate (%) (Standard Error (%))	Weighted Percentage 1+ Varicella at 12+ Months Estimate (%) (Standard Error (%))
Hispanic	26.84	70.39 (1.78)	81.82 (1.59)	91.77 (1.14)
Non-Hispanic white only	47.01	71.51 (0.90)	84.16 (0.74)	90.33 (0.56)
Non-Hispanic black only	12.78	66.47 (2.22)	78.14 (1.83)	89.28 (1.24)
Non-Hispanic American Indian or Alaska Native only	0.92	65.92 (5.11)	72.54 (4.84)	88.13 (3.15)
Non-Hispanic Asian only	5.40	72.36 (3.44)	82.12 (3.15)	95.68 (1.00)
Non-Hispanic Native Hawaiian or Pacific Islander only	0.23	67.72 (7.61)	80.00 (6.21)	86.07 (5.62)
Multiple races	6.81	69.79 (2.82)	82.27 (2.33)	92.90 (1.20)
Non-Hispanic white/black	3.11	71.06 (4.21)	82.58 (3.25)	91.95 (1.96)
Non-Hispanic white/ American Indian or Alaska Native	0.86	58.95 (7.74)	74.38 (8.55)	93.31 (2.13)
Non-Hispanic white/Asian	1.84	73.67 (5.19)	88.35 (3.21)	95.60 (2.11)
Non-Hispanic other combination	0.99	68.00 (6.32)	76.91 (6.28)	90.52 (3.35)

Note: UTD = up-to-date. Weighted by PROVWT_D. Children with an unknown Hispanic origin and/or race were imputed by a hot-deck method. This table includes both landline and cell-phone interviews, but excludes U.S. territories.

* 4+ diphtheria and tetanus toxoids and acellular pertussis vaccine adsorbed, diphtheria and tetanus toxoids and pertussis vaccine, or diphtheria and tetanus toxoids vaccine adsorbed (DTaP/DTP/DT); 3+ poliovirus vaccine; 1+ measles-containing vaccine (MCV); full series *Haemophilus influenzae* type b conjugate vaccine (Hib), i.e., 3 or 4 doses depending on type of vaccine received; 3+ hepatitis B vaccine (Hep B); 1+ varicella at or after 12 months of age; and 4+ pneumococcal conjugate vaccine (PCV).

4.8. Subsets of the NIS-Child Data

The NIS-Child public-use data file contains data for all eligible children who have a completed household interview. An interview is considered complete if the respondent completed Section C of the questionnaire. As explained in Section 6 of this guide, each child with a completed household interview is assigned a weight (**RDDWT_D**) for use in estimation.

The NIS-Child uses the synthesized provider-reported vaccination histories to form the estimates of vaccination coverage because the provider data are considered more accurate than household-reported data. Thus, the most important subset of the data consists of children with adequate provider data. For these children, one or more providers returned an immunization history questionnaire that included vaccination data. Unvaccinated children are also considered to have adequate provider data. As discussed in Section 7 below, the **PDAT** variable identifies the children with adequate provider data (**PDAT**=1). These children have a separate weight **(PROVWT_D**), which should be used to form estimates of vaccination coverage (see Section 6).

4.9. Confidentiality and Disclosure Avoidance

To prevent identification of participants in the NIS-Child and the resulting disclosure of information, certain items from the questionnaires are not included in the public-use data file. In addition, some of the released variables either are top- or bottom-coded, or have their categories collapsed. Variable labels indicate which variables have been re-coded in these ways.

5. Quality Control and Quality Assurance Procedures

A major contributor to NIS-Child data quality is its sample management system, which in 2017 managed over 490 sample frame by estimation area by quarter samples and used a number of performance measures to track their progress toward completion. Important aspects of the quality assurance program for the RDD component of the NIS-Child included on-line interviewer monitoring; on-line provider look-

ups in a database system integrated with the CATI system, including names, addresses, and telephone numbers of vaccination providers; and automated range-edits and consistency checks. These and other quality assurance procedures contributed to a reduction in total data collection cost by minimizing interviewer labor and overall burden to respondents. Khare et al. (2000), Khare et al. (2001), and the *National Immunization Survey: Guide to Quality Control Procedures* (CDC 2002) describe quality assurance procedures.

The Provider Record Check component used quality control measures at four junctions: prior to mailing packets to providers; during the telephone prompting effort; during the editing of returned questionnaires; and during and after their data entry. The final quality assurance activities are implemented during post-processing of the returned questionnaires or vaccination records. All returned questionnaires were examined to identify and correct any obvious errors prior to data entry and then key-entered with 100% verification. The keying error rate is estimated, by way of a second verification process, to be less than 1%.

6. Sampling Weights

Each of the two phases of data collection results in a separate sampling weight for each child that has data at that phase. The RDD-phase sampling weights permit analyses of data for children with completed household interviews. Each child with adequate provider data (the subset on which official estimates of vaccination coverage are based) has a provider-phase sampling weight. The dual-frame RDD-phase sampling weight variable for producing estimates for children with completed household interviews is called **RDDWT_D**. The dual-frame provider-phase sampling weight variable for producing estimates for children with adequate provider data is called **PROVWT_D**. See Section 8 of this user's guide for more information about the weights included in the data file and the proper way to use them.

As discussed below, revisions in weighting methodology were made on various occasions and the names of the weight variables were also changed to keep track of the revisions. The RDD-phase sampling weights were called HY_WGT in 1995-2001, RDD_WT in 2002, WGT_RDD in 2003- 2004, RDDWT in 2005-2008, RDDWT/RDDWTVI in 2009-2010, RDDWT_LL/RDDWTVI_LL/RDDWT_D in 2011, RDDWT_D/RDDWTVI_D in 2012, RDDWT_D/RDDWTVIGU_D in 2013, RDDWT_D/RDDWT_D_TERR in 2014-2016, and RDDWT_D in 2017**.** The provider-phase sampling weights were called W0 in 1995-2001, WT in 2002, WGT in 2003- 2004, PROVWT in 2005-2008, PROVWT/PROVWTVI in 2009-2010, PROVWT_LL/PROVWTVI_LL/PROVWT_D in 2011, PROVWT_D/PROVWTVI_D in 2012, PROVWT_D/PROVWTVIGU_D in 2013, PROVWT_D/PROVWT_D_TERR in 2014-2016, and PROVWT_D in 2017**.**

A sampling weight may be interpreted as the approximate number of children in the target population that a child in the sample represents. Thus, for example, the sum of the sampling weights of children with adequate provider data who are up-to-date (on a particular vaccine or series of vaccines) yields an estimate of the total number of children in the target population who are up-to-date. Dividing this sum by

the total of the sampling weights for all children with adequate provider data gives an estimate of the corresponding vaccination coverage rate.

This section describes how these weights are developed and adjusted so as to achieve an accurate representation of the target population. The base weights reflect each telephone number's probability of being selected into the sample; the adjustments take into account non-resolution of residential/non-residential/non-working status of a telephone number, non-response to the screener and household interviews, number of telephone lines in the household, combination of landline and cell-phone sample sources, raking for differential coverage rates and non-coverage of households that do not have telephones, non-response by providers, and a final raking adjustment. Note that when deriving dual-frame weights, the initial adjustments described below are performed separately for the landline and cell-phone samples, and then both samples are combined and further adjustments are performed on the combined samples.

6.1. Base Sampling Weight

In each quarterly NIS-Child sample, each child with a completed household interview receives a base sampling weight. For all four quarters of the landline and cell-phone samples, the base sampling weight is equal to the total of telephone numbers in the sampling frame for the estimation area divided by the total of telephone numbers that were randomly sampled from that sampling frame and released for interview during that quarter.

6.2. Adjustments for Non-Resolution of Telephone Numbers, Screener Non-Response, and Interview Non-Response

Non-response occurs in population-based surveys when potential respondents refuse to participate, are not available at the time of the interview, or could not be reached during the survey period. Thus, the sum of the base sampling weights of children with completed household interviews will underestimate the size of the target population in the estimation area, because not all sampled households respond to all stages of

data collection up to the household interview. As a result, the base sampling weights must be adjusted so they accurately reflect the number of children in the target population that each sampled child with a completed household interview represents.

Some sampled households with age-eligible children fail to complete the household interview because of unit non-response: for some telephone numbers, it is never determined whether or not the number is a working residential number despite multiple call attempts; for some households it is never determined whether or not the household contains age-eligible children; and some households with age-eligible children do not complete the household interview. To compensate for these three types of unit non-response, the sampling weights of children with a completed household interview are adjusted to account for the estimated number of age-eligible children in households whose telephone numbers are never resolved, the estimated number of age-eligible children in households that fail to complete the screening interview, and the number of identified age-eligible children for whom the household interview is not completed. For the landline sample, each of these adjustments is carried out within each estimation area by forming weighting cells based on the residential directory-listed status of the sample telephone number, percent of the population that is white in the telephone exchange, and MSA status of the telephone exchange (i.e., weighting cells were formed from directory-listed versus non-directory-listed telephone number; telephone exchanges with 75% or higher white population versus telephone exchanges with less than 75% white population; and MSA/non-MSA status). For the cell-phone sample, each of these adjustments is carried out within estimation area by forming weighting cells based on MSA/non-MSA status of the wire center associated with the cell-phone number. Each cell in each stage of adjustment must have sufficient resolved/responding cases (usually 20, but 15 for interview non-response) at that stage of adjustment; cells with a deficient number of responding cases are collapsed into neighboring cells. The order of the variables in cell collapsing for the landline sample is MSA status, percent of population that is white, and directory listed status of the telephone number, and for the cell-phone sample, both MSA categories are collapsed if either of the cells have a deficient number of

responding cases. Once the adjustment cells are formed, the weights of the unresolved/non-responding records from the previous adjustment step are distributed to the weights of the resolved/responding records within each cell.

6.3. Adjustment for Multiple Telephone Lines and Deriving Annual Weights

Once the non-response-adjusted interview weights for households are computed, these weights are adjusted for additional telephone lines in the household. Because households with multiple telephone lines have a greater chance of being sampled, for the landline sample each child's household interview weight is adjusted by dividing it by the total number of residential landlines reported in the household (up to a maximum of 3), and for the cell-phone sample each child's household interview weight is adjusted by dividing it by the total number of cell-phones used by parents or guardians (up to a maximum of 3). Prior to 2005, the adjustment for multiple telephone lines was made by adjusting the base sampling weights before making any other adjustments. Beginning in 2005, the adjustment for multiple telephone lines has been shifted after the interview non-response adjustment, because the information on the number of telephone lines in a household is available only for households with completed household interviews. This shifts the adjustment for multiple telephone lines to the point where the information about the number of telephone lines is actually collected.

Up to the previous step, the sampling weights are adjusted separately for each quarter and sample type (landline, cell-phone), and the weights in each quarter pertain to the target population. However, annual vaccination coverage estimates are obtained from data for four consecutive quarters, so the weights in each quarterly file are adjusted when the data from the four quarters of the landline and cell-phone samples are combined. The adjustment factor is proportional to the number of households with completed household interviews in each quarter within sample type (landline, cell-phone) and estimation area.

6.4. Calibration

Next, survey weights are calibrated to population control totals as described below. The control totals used for the NIS-Child are derived from current natality data from the National Center for Health Statistics (NCHS 2014, 2015b). Because the Vital Statistics data give the counts of all live births in the United States, regardless of whether the household has telephone service, the control totals include all eligible children. The control total for each raking dimension is derived from the NCHS natality files from 2014 and 2015 (children born between July 1, 2014 and November 30, 2015 would have been 19 through 35 months on June 30, 2017). Use of the natality data to form the required population control totals for the NIS-Child has three limitations: 1) the natality file provides a universe of live births and therefore does not reflect infant mortality; 2) the natality file does not include children born outside the United States who immigrate to this country before reaching ages 19 through 35 months; and 3) the natality file records residence at time of birth, and some children may move from one estimation area to another by the time they reach 19 through 35 months of age. Adjustments are made to the natality data to account for these three factors. **For 2017, the combined 2014, 2015, and 2016 one-year American Community Survey Public Use Microdata Sample data files were used to make the immigration and migration adjustments.**

The proportions of 19 through 35 month old children by detailed telephone status (cell-phone-only, landline and cell-phone dual user, landline-only, phoneless) within each estimation area were derived using a similar small area modeling approach as described in Blumberg et al. (2011). These modeled telephone status estimates are applied to the population control total for the estimation area to estimate the control totals by detailed telephone status within the estimation area.

Survey weights for the landline and cell-phone samples must be integrated to provide dual-frame weights for the full target population of age-eligible children. The landline and cell-phone sampling frames overlap in coverage of children in landline and cell-phone dual use households and exclude children in phoneless households. The critical issues associated with combining the landline and cell-phone samples

are: a) adjustment for overlap of the landline and cell-phone samples; and b) adjustment for noncoverage of children in phoneless households.

Prior to combining the landline and cell-phone samples, survey weights are adjusted to agree with independent estimates of the population total by telephone status. Adjustments to population totals by telephone status are made separately for the landline sample and the cell-phone sample (with the overlap adjusted for in the next step, as explained below). Since the proportion of children living in landline-only households is continuously decreasing (and thus, the number of landline-only sample cases is small), children in dual landline and cell-phone households from the landline sample are combined with children in landline-only households and then adjusted to the combined population estimate of children living in dual user and landline-only households within each estimation area. In the cell-phone sample, in each estimation area children in dual landline and cell-phone households are weighted to represent children living in dual landline and cell-phone households in the estimation area, and children in cell-phone-only households are weighted to represent children in cell-phone-only households in the estimation area.

Next, since the landline and cell-phone sampling frames overlap in coverage of children in landline and cell-phone dual-use households, children in dual-user households from both samples are combined based on the effective number of children with a completed household interview within each sample type (landline, cell-phone), and are weighted to represent children in dual-use households within each estimation area. Finally, children in phoneless households, which are excluded from the dual-frame sample, are accounted for in the raking step described below.

To reduce sampling variability and improve the precision of estimation, extreme weights are trimmed and then recalibrated to control totals. RDD sampling weight values exceeding the median weight plus three times the interquartile range of the weights within an estimation area are truncated and then recalibrated to control totals. This is done by up to five iterations. This weight trimming prevents children with unusually large weights from having an unusually large impact on immunization coverage estimates.

The final step in adjusting the RDD sampling weights is a raking adjustment (Deming 1943) of the trimmed, telephone status adjusted weights. The raking procedure uses estimation area-level control totals for maternal education categories, maternal race/ethnicity, age group of the child, sex of the child, and telephone status. Briefly, raking takes each variable in turn and applies a proportional adjustment to the current weights of the children who belong to the same category of the variable. After a number of iterations over all the variables, the raked weights have totals that match all the desired control totals. Raking makes it possible to incorporate additional variables into the weighting and to use more detailed categories for those variables. Wolter et al. (2017a) gives the details of various aspects of the NIS-Child estimation procedures.

The sampling weights after all the foregoing adjustments constitute the "RDD sampling weights" **(RDDWT_D**).

6.5. Adjustment for Provider Non-Response

Among the 28,465 children with a completed household interview from the landline and cell-phone samples (excluding Guam), 15,333 (53.9%) had adequate provider data. Starting with the 2002 NIS-Child public-use data file, the definition of children with adequate provider data includes unvaccinated children. These are children for whom the respondent reported during the household interview that the child had received no vaccinations and has no providers, or for whom one or more providers were reported but those providers reported administering no vaccinations. Among the 15,333 children with adequate provider data, 290 were unvaccinated children. Failure to obtain adequate provider data for the remaining 46.1% was attributable to:

- parent or guardian not identifying any providers or not giving consent to contact the child's vaccination provider(s) (36.6%);
- consent to contact vaccination providers obtained but no providers returned the immunization history questionnaire (5.1%); and

- one or more providers returned the immunization history questionnaire, but no providers reported any vaccination data, despite the parent or guardian indicating that the child has received vaccinations (4.5%).

The 13,132 children for whom a household interview was completed but adequate provider data were not obtained are classified as "partial non-responders" because they have only a partial response to the NIS-Child as a whole.

Empirical results suggest that children with adequate provider data have characteristics believed to be associated with a greater likelihood of being up-to-date, compared with children who had missing provider data. Specifically, children with adequate provider data are more likely to live in households that have higher total family income, have a white mother, and live outside a central city of a Metropolitan Statistical Area. Also, a child with missing provider data is less likely to live in the state where the mother lived when the child was born. These factors indicate a potential lack of continuity of health care, and are associated with lower vaccination coverage (Coronado et al. 2000). If no adjustment is made to the RDD sampling weights to account for these differences, estimated vaccination coverage rates may be biased.

To reduce potential bias in estimators of vaccination coverage attributable to partial non-response, a weighting-class adjustment is used in each estimation area (Brick and Kalton 1996). This adjustment involves three steps. In the first step, sampled children are classified according to the quintile of their estimated probabilities of having adequate provider data. In the statistical literature these probabilities are called response propensities (Rosenbaum and Rubin 1983, 1984; Rosenbaum 1987). Children who have similar response propensities will also be similar with respect to variables that are strongly associated with the probability of having adequate provider data. In this important respect, children in each class are comparable. Because of this comparability, any sub-sample of children in a class may represent all children in the class. Therefore, the weighting-class adjustment uses the children with adequate provider data to represent all children in the class. An NCHS Series 2 Report on the statistical methodology of the

NIS-Child (Smith et al. 2005) includes details of the methodology for forming weighting classes based on propensity scores. This report can be viewed at http://www.cdc.gov/nchs/data/series/sr_02/sr02_138.pdf.

In the second step of this weighting-class adjustment, within each class an adjustment factor redistributes the RDD sample weights of the children with missing provider data to the weights of the children who have adequate provider data. These adjusted sampling weights of children with adequate provider data are initial non-response-adjusted provider-phase weights. The model for children with adequate provider data includes significant main effects, and also significant two-way interactions between sample type (landline, cell-phone) and all other variables.

Within an estimation area, the sums of non-response adjusted weights of children with adequate provider data for the various levels of important socio-demographic variables (such as race/ethnicity) may not be equal to corresponding population totals. To reduce bias attributable to these differences, raking was used in the third step to adjust the non-response adjusted weights to match estimation area control totals. Control totals for these variables were estimated using the weighted totals from the sample of children with completed household interviews. Smith et al. (2001b, 2005) describe the development of this approach in more detail. Similar to the RDD weighting, the extreme weights exceeding the median weight plus three times the interquartile range of the weights within an estimation area are truncated and then recalibrated to control totals. These raked weights of children with adequate provider data are called "final provider-phase weights" **(PROVWT_D**). Because of the comparability of children within each weighting class, any estimate that uses data only from the children with adequate provider data along with their provider-phase sampling weights will have less bias attributable to differences between children with adequate provider data and children with missing provider data.

Appendix B summarizes the distribution of the sampling weights **(RDDWT_D** and **PROVWT_D)** in each estimation area.

NIS-Child public-use data files for 1995 to 2001 do not include sampling weights that account for the effect of unvaccinated children. An assessment of the effect of accounting for unvaccinated children for the period 1995 to 2003 was made. Weights were calculated for each year with and without unvaccinated children and the vaccination coverage estimates compared. Details of this assessment and the results are available in the user's guide for the 2004 NIS-Child public-use data file. At the national level, accounting for unvaccinated children had very little effect on the estimates of 4:3:1:3 vaccination coverage. Within estimation areas also, the two coverage estimates differed little. The largest difference (in either direction) was most often around 2 percentage points. Differences of that magnitude are small relative to the standard errors of the estimates. Although accounting for unvaccinated children has a small effect on estimates of vaccination coverage, data users who use the pre-2002 public-use data files to examine estimation area-level trends over time are advised to interpret the results with appropriate caution.

7. Contents of the Public-Use Data File

The NIS-Child public-use data file contains a record for each eligible child for whom Section C of the household interview was completed, along with household-reported information about the child and the child's mother. For children with Immunization History Questionnaires (IHQs) returned by one or more providers, the file also contains provider characteristic variables, as well as variables based on the child's synthesized provider-reported vaccination history: the age of the child at each vaccination, the number of each type of vaccination received, and indicators of whether the child is up-to-date with respect to various recommended vaccines and vaccine series.

The public-use data file consists of ten sections, the contents of which are described below in detail. For additional information, users are encouraged to consult the codebook (NCIRD 2018). The codebook is divided into the ten sections described below and contains variable names, labels, and response frequencies (for categorical variables). For select variables, the codebook also gives additional information about the variable in the "Notes" field.

Table 5 lists key NIS-Child variables commonly used in analyses. A full list of variables appearing on the 2004-2017 NIS-Child public-use data files appears in Appendix E, along with the reason for the addition, subtraction, or modification of the variables in 2005-2017. Information on changes made between 1995-2004 can be found in the *Alphabetical Listing of Variables that are Not Available in All Public-Use Data Files, National Immunization Survey, 1995-2004*.

http://www.cdc.gov/nchs/data/nis/pufvariables1995to2004.pdf

Table 5: NIS-Child Variables Commonly Used in Analyses or for Published Estimates

Variable	Categories
ID Variables	
SEQNUMC – unique child ID variable	
SEQNUMHH – unique household ID variable	
Geographic Variables	
ESTIAP17 – estimation area number (ITRUEIAP used through 2004; ESTIAP in 2005; ESTIAP06 in 2006; ESTIAP07 in 2007; ESTIAP08 in 2008; ESTIAP09 in 2009; ESTIAP10 in 2010; ESTIAP11 in 2011; ESTIAP12 in 2012; ESTIAP13 in 2013; ESTIAP14 in 2014; ESTIAP15 in 2015; ESTIAP16 in 2016; ESTIAP17 in 2017)	
STATE – state FIPS code	
CEN_REG – census region	Northeast Midwest South West
Child Demographic Variables	
AGEGRP – age category of child	19-23 months 24-29 months 30-35 months
RACEETHK – race/ethnicity of child (introduced in 2002; RACEKIDR used in 1995-2001)	Hispanic White alone, non-Hispanic Black alone, non-Hispanic All other races alone and multiple races, non-Hispanic
SEX – sex of child	Male Female
FRSTBRN – firstborn status of the child	No Yes
Mother Demographic Variables	
EDUC1 – education of the mother	<12 years 12 years >12 years, not a college graduate College graduate
MARITAL2 – marital status of mother (Living with partner response option added to questionnaire in 2015)	Currently married Never married, widowed, divorced, separated, deceased, or living with partner
M_AGEGRP2 – age group of mother (introduced in 2016; M_AGEGRP used through 2015)	<=29 years 30 years or older
Poverty Variables	
INCPOV1 – poverty status (introduced in 2005; INCPOV1R used through 2004)	At or above poverty level, income > $75,000 At or above poverty level, income <= $75,000 Below poverty level Not determined
INCPORAR – income-to-poverty ratio (introduced in 2005; INCPORAT used through 2004)	
INCPORAR_I – imputed income-to-poverty ratio (introduced in 2016)	
WIC Variables	

Variable	Categories
CWIC_01 – child ever participated in WIC program	Yes No Never heard of WIC Don't know Refused Missing
CWIC_02 – child currently participating in WIC program	Yes No Don't know Refused Missing
Breastfeeding Variables	
CBF_01 – child ever fed breast milk	Yes No Don't know Missing
BF_ENDR06 – length of time in days child was fed breast milk	
BF_EXCLR06 – length of time in days child was exclusively fed breast milk or formula (introduced in 2006)	
BF_FORMR08 – age in days when child was first fed formula (introduced in 2008; BF_FORMR06 used in 2006 and 2007)	
Chicken Pox Variables	
HAD_CPOX – did child ever have chicken pox (introduced in 2005; I_HADCPX used through 2004)	Yes No Don't know Refused Missing
AGECPOXR – age in months when child had chicken pox (introduced in 2005; IAGECPXR used through 2004)	0-6 months 7-12 months 13-18 months 19-24 months 25-30 months 31 months or older Missing
Presence of Provider Data Variables	
PDAT – adequate provider data indicator	Yes No
Number of Provider-Reported Doses of Vaccine Variables	
P_NUMDTP – total number of DTaP/DTP/DT doses	
P_NUMPOL – total number of polio doses	
P_NUMMMR – total number of MCV doses	
P_NUMHIB – total number of Hib doses	
P_NUMHEP – total number of hepatitis B doses	
P_NUMVRC – total number of varicella doses	
P_NUMPCV – total number of pneumococcal doses	
P_NUMFLU – total number of seasonal influenza doses	
P_NUMHEA – total number of hepatitis A doses	
P_NUMROT – total number of rotavirus doses	
Provider Characteristic Variables	

Variable	Categories
PROV_FAC – provider facility type	All public facilities All hospital facilities All private facilities All military/other facilities Mixed types Unknown
VFC_ORDER – do child's providers order vaccines for children from state/local health department? (introduced in 2006)	All providers Some but not all providers No providers Unknown
REGISTRY – provider(s) reported child's vaccination(s) to state or community immunization registry	All providers Some but not all providers No providers Unknown
Insurance Status Variables	
INS_STAT2_I – child's current health insurance coverage status (introduced in 2017, INS_STAT_I used in 2016)	Private insurance only Any Medicaid Other insurance Uninsured
INS_BREAK_I – child's insurance history since birth (introduced in 2016)	Currently insured but uninsured since birth Currently insured and never uninsured since birth Currently uninsured but insured since birth Currently uninsured and never insured since birth

Before describing the sections of the public-use data file below, we first summarize the differences between the 2016 and 2017 NIS-Child public-use data files:

- **Because the 2017 estimation areas differ from those used in prior years, a new 2017 estimation area variable has been added (ESTIAP17) and the 2016 estimation area variable (ESTIAP16) has been dropped. Note that Travis County, Texas, a new estimation area added for 2017, is identified by ESTIAPT17=108. Although data were collected for Guam in 2017, children in this area are not included on the public-use data file in order to protect confidentiality. Data for the U.S. Virgin Islands and Puerto Rico are also not included on the 2017 public-use data file as data collection in these areas was suspended due to Hurricane Maria.**
- **The health insurance status variable INS_STAT_I was replaced by a new variable INS_STAT2_I, which provides the same information except that children with both private**

insurance and another non-private, non-Medicaid type of insurance are now categorized as (3) Other insurance, instead of (1) Private insurance, and category (1) now designates children with private insurance only.

7.1. Section 1: ID, Weight, and Flag Variables

SEQNUMHH and SEQNUMC are the unique household and child identifiers, respectively. **PDAT** indicates which children are considered to have adequate provider data. As described in Section 6 of this report, **RDDWT_D** and **PROVWT_D** are the final household- and provider-phase weights, respectively. **PROVWT_D** should be used when analyzing the provider-reported data, i.e., the variables in Sections 7, 8, and 9 of the NIS-Child public-use data file.

7.2. Section 2: Household-Reported Vaccination and Chickenpox Information

Section 2 of the public-use data file contains variables derived from the information collected in Section B of the household questionnaire. In particular, it contains variables indicating whether the respondent reported that the child has had chicken pox disease **(HAD_CPOX)** and the child's age in months at chicken pox disease **(AGECPOXR).**

7.3. Section 3: Demographic, Socio-Economic, and Other Household/Child Information

Section 3 of the NIS-Child public-use data file consists of information collected during the household screening interview and Section C of the household main interview. To protect confidentiality, many of these variables have been collapsed, top-coded, or bottom-coded from the original, fully-detailed versions; the variable labels (see the public-use date file codebook) indicate which variables have been collapsed or recoded.

AGEGRP is the age of the child in months in three categories (19-23 months, 24-29 months, 30-35 months), based on the child's best date of birth and the eligibility date. **SEX** gives the sex of the child,

and **FRSTBRN** indicates whether the child is the first born, with missing values of these variables imputed. The language in which the interview was conducted is stored in variable **LANGUAGE**, and **C5R** gives the relationship of the respondent to the child.

The breastfeeding variables include whether the child was ever fed breast milk **(CBF_01)**, length of time in days the child was fed breast milk **(BF_ENDR06)**, the age in days when the child was first fed formula **(BF_FORMR08)**, and the length of time in days the child was exclusively fed breast milk or formula **(BF_EXCLR06)**. Two types of inconsistencies arise in the breastfeeding data: 1) duration of any breastfeeding can exceed age of the child, and 2) age when the child was first fed formula can exceed the age of the child. **BFENDFL06** is set equal to 1 when BF_ENDR06 exceeds the age of the child (with a buffer), and **BFFORMFL06** is set equal to 1 when BF_FORMR08 exceeds the age of the child (with a buffer). Appendix C provides details on how the flags were created. Data users are cautioned to review Appendix C before analyzing any of the breastfeeding variables.

The WIC variables include whether the child ever participated in the WIC program **(CWIC_01)** and whether the child is currently participating **(CWIC_02)**.

C1R and **CHILDNM** give the number of people and children, respectively, in the household. The child's Hispanic origin indicator, race with three categories, and race/ethnicity with four categories are presented in variables **I_HISP_K**, **RACE_K**, **and RACEETHK**, respectively; for each of these variables, missing values have been imputed. The age, education level, and marital status of the mother of the child are stored in variables **M_AGEGRP2**, **EDUC1**, and **MARITAL2** (married vs. not married), with missing values imputed.

The categorized total combined income for the child's family is given by **INCQ298A. INCPOV1** gives the family's poverty status (at or above poverty, income > $75,000; at or above poverty, income <= $75,000; below poverty; unknown), and **INCPORAR** gives the ratio of the family's income to the

poverty level. **INCPORAR_I** gives the same ratio after missing values of family income have been imputed. Household tenure is given by **RENT_OWN**.

The number of landline telephone numbers in the household, the number of working cell phones household members have available for personal use, and the number of these cell phones that are usually used by parents or guardians are given by **NUM_PHONE**, **NUM_CELLS_HH**, and **NUM_CELLS_PARENTS**, respectively.

Variable **CEN_REG** gives the census region of the respondent's current residence, and **MOBIL_I** indicates whether the mother's current state of residence is the same as her state of residence at the time of the child's birth.

7.4. Section 4: Geographic Variables

Variables **ESTIAP17** and **STATE** give the 2017 estimation area and state of residence, respectively, for each child. **EST_GRANT** indicates which of the 50 states, District of Columbia, and 5 local areas that receive federal Section 317 immunization awards (Bexar County, TX; City of Chicago, IL; City of Houston, TX; New York City, NY; Philadelphia County, PA) the child resides in.

7.5. Section 5: Number of Providers Identified and Consent Variables

Variable **D7** indicates whether the respondent gave consent to contact the child's providers. If D7=1, then consent was granted; if D7=2 then consent was explicitly denied; and if D7 is missing, consent was not granted because the respondent broke off the interview before being explicitly asked for consent.

Variable **D6R** gives the number of providers identified by the respondent. Note that sometimes respondents report erroneous provider counts and sometimes report the same provider more than one time, and D6R does not reflect cleaning or de-duplication of the initially-reported provider count.

7.6. Section 6: Number of Responding Providers Variables

Variable **N_PRVR** indicates the number of providers returning IHQs with vaccination information for the child. That is, N_PRVR is the number of IHQs that were returned for the child that contain information on the IHQ shot grid.

7.7. Section 7: Characteristics of Providers Variables

The variables in this section of the public-use data file summarize the information collected in IHQ questions 5c, 6, and 7 across the child's providers who returned IHQs containing vaccination (i.e., shot grid) data.

PROV_FAC indicates the facility type of the child's vaccination providers based on responses to IHQ question 5c. If all of the child's providers that returned IHQs containing shot grid data (see Section 6 variable N_PRVR) reported the facility type to be:

- a public health department-operated clinic, community health center, or rural health clinic, then PROV_FAC=1 (all public facilities);
- a hospital-based clinic, then PROV_FAC=2 (all hospital facilities);
- a private practice, then PROV_FAC=3 (all private facilities);
- a military health care facility, WIC clinic, school-based health center, pharmacy, or other type of facility, then PROV_FAC=4 (all military/WIC/school/pharmacy or other facilities).

If the responses of providers that returned IHQs containing shot grid data fell into more than one of the above bulleted categories, PROV_FAC=5 (mixed); otherwise, if at least one of the child's providers returned an IHQ containing shot grid data, PROV_FAC=6 (unknown). If none of the child's providers returned an IHQ containing shot grid data, PROV_FAC is set to missing.

The Vaccines For Children (VFC) program is a federally-funded program that provides vaccines at no cost to children who might not otherwise be vaccinated because of inability to pay

(http://www.cdc.gov/vaccines/programs/vfc/index.html). CDC buys vaccines at a discount and distributes them to awardees—i.e., state health departments and certain local and territorial public health agencies—which in turn distribute them at no charge to those private physicians' offices and public health clinics registered as VFC providers. **VFC_ORDER**, based on responses to IHQ question 6, indicates whether the child's vaccination providers order vaccines from a state or local health department to administer to children. If all of the child's providers that returned IHQs containing shot grid data (see Section 6 variable N_PRVR) reported that they order vaccines from a state or local health department to administer to children, then VFC_ORDER=1 (all providers); if at least one of the child's providers that returned an IHQ containing shot grid data reported that the practice orders vaccines from a state or local health department to administer to children and the child's other providers that returned IHQs containing shot grid data reported either that they did not order such vaccines or that they did not know whether or not they did, then VFC_ORDER=2 (some but possibly or definitely not all providers); if all of the child's providers that returned IHQs containing shot grid data reported that they do not order vaccines from a state or local health department to administer to children, then VFC_ORDER=3 (no providers); if none of the conditions for VFC_ORDER=1, 2, or 3 were met but at least one of the child's providers returned an IHQ containing shot grid data, VFC_ORDER=4 (unknown). If none of the child's providers returned an IHQ containing shot grid data, VFC_ORDER is set to missing. Note that having a provider that orders VFC vaccines does not imply that the child is VFC-entitled; providers enrolled in the VFC program could also vaccinate children who are not VFC-entitled.

REGISTRY is based on responses to IHQ question 7 and indicates whether the child's vaccination providers reported the child's vaccinations to a local or state immunization registry (also known as an Immunization Information System, or IIS). If all of the child's providers that returned IHQs containing shot grid data (see Section 6 variable N_PRVR) indicated that they reported to a registry, then REGISTRY=1 (all providers); if at least one of the child's providers that returned an IHQ containing shot grid data indicated that the practice reported to a registry and the child's other providers that returned

IHQs containing shot grid data indicated that they did not report to a registry, that they did not know whether or not they reported to a registry, or that the question is not applicable, then REGISTRY=2 (some but possibly or definitely not all providers); if all of the child's providers that returned IHQs containing shot grid data indicated that they did not report to a registry or that the question is not applicable, then REGISTRY=3 (no providers); if none of the conditions for REGISTRY=1, 2, or 3 were met but at least one of the child's providers returned an IHQ containing shot grid data, REGISTRY=4 (unknown). If none of the child's providers returned an IHQ containing shot grid data, REGISTRY is set to missing.

7.8. Section 8: Provider-Reported Up-To-Date Vaccination Variables

This section contains vaccination count and up-to-date variables based on the child's synthesized provider-reported vaccination history. To facilitate data processing and to accommodate the large and continually growing number of vaccination types covered by the NIS-Child, the provider-reported vaccination data are organized around the concept of vaccine categories and vaccine types within vaccine category. The vaccine categories correspond to the sections of the IHQ shot grid, and the vaccine types correspond to the type boxes on the IHQ shot grid. (For each vaccine category, an "unknown" vaccine type is created for vaccinations that are reported without a type box being checked. Also, a few vaccine types, such as Measles-Mumps, arise through the backcoding of shots initially reported in the "other" section of the IHQ shot grid.) Table 6 shows the vaccine categories and types for the 2017 NIS-Child. Note that a single vaccination can fall into more than one vaccine category; for example, an MMR-Varicella vaccination is part of both the Measles-containing and Varicella-containing vaccine categories. (The full list of vaccine type codes can also be found in Appendix H.)

For each vaccine category, Section 8 of the public-use data file contains a variable typically named **P_NUM*YYY*** – where "YYY" is the vaccine category abbreviation given in Table 6 – that stores the number of vaccinations in that vaccine category in the child's synthesized provider-reported vaccination history. For each vaccine type in Table 6, Section 8 also contains a variable that stores the number of

vaccinations of that vaccine type in the child's synthesized provider-reported vaccination history. For example, **P_NUMDHI** is the number of DTaP/HepB/IPV shots in the child's history.

This section of the public-use data file also contains up-to-date indicators for a variety of recommended vaccines and vaccine series. These variables' names typically begin with "**P_UTD**". Additional variables indicate whether the child is up-to-date for various vaccine series. For example, **P_UTD431** indicates whether the child has received 4 or more DTaP/DTP/DT shots, 3 or more polio shots, and one or more measles-containing shots. The variable labels indicate what is needed to be considered up-to-date for each variable, and the "Notes" field in the codebook shows the vaccine type codes (see Table 6) being included when determining whether the child is up-to-date.

Note that it is possible that the administration of the NIS-Child interview itself prompts some respondents to vaccinate their children following the interview; to ensure that the vaccination coverage estimates are not artificially boosted because of this, the synthesized vaccination history count and up-to-date variables in this section of the public-use data file count only vaccinations received before the date the household interview was completed. Note also that because children are eligible for the NIS-Child if they are 19 to 35 months old on any day of the survey quarter, some children are less than 19 months old or greater than 35 months old on the date the household interview is completed. For children with interviews conducted before they became 19 months old, the Provider Record Check is not conducted until after the child has become 19 months old, and all vaccinations given up to age 19 months are counted, including those given after the household interview date. For children with interviews conducted after they became 36 months old, only vaccinations given through age 35 months are counted.

Table 6: Vaccine Categories and Vaccine Types, National Immunization Survey - Child, 2017

Vaccine Category Abbreviation	Vaccination Category Description	Vaccine Type Code	Vaccine Type Description
DTP	DTaP/DTP/DT-containing vaccine	03	DTaP/DTP/DT-containing, unknown type
		04	DTaP/DTP/DT
		07	DTaP-Hib

Vaccine Category Abbreviation	Vaccination Category Description	Vaccine Type Code	Vaccine Type Description
		08	DTaP-HepB-IPV
		D3	DTaP-IPV-Hib
POL or POLIO	Polio-containing vaccine	08	DTaP-HepB-IPV
		20	OPV
		21	IPV
		22	Polio-containing, unknown type
		D3	DTaP-IPV-Hib
MCV or MMR	Measles-containing vaccine	30	MMR
		31	Measles only
		32	Measles-mumps
		33	Measles-rubella
		MM	Measles-containing, unknown type
		VM	MMR-Varicella
HIB	Hib-containing vaccine	07	DTaP-Hib
		43	HepB-Hib
		44	Hib-only, unknown type
		D3	DTaP-IPV-Hib
		HG	Hib-only (GSK)
		HI	Hib-containing, unknown type
		HM	Hib-only (Merck)
		HS	Hib-only (Sanofi)
		HY	Hib-MenCY
HEPB or HEP	Hepatitis B-containing vaccine	08	DTaP-HepB-IPV
		43	HepB-Hib
		60	HepB-only
		HB	HepB-containing, unknown type
VRC	Varicella-containing vaccine	VA	Varicella-containing, unknown type
		VM	MMR-Varicella
		VO	Varicella-only
PCV	Pneumococcal-containing vaccine	70	Conjugate-unknown
		71	Polysaccharide
		72	Pneumococcal-containing, unknown type
		73	Conjugate-7
		74	Conjugate-13
HEPA or HEA	Hepatitis A-containing vaccine	HA	Hepatitis A
INFLUENZA	Seasonal influenza vaccine	FL	Seasonal influenza, unknown type
		FM	Seasonal influenza spray
		FN	Injected seasonal influenza

Vaccine Category Abbreviation	Vaccination Category Description	Vaccine Type Code	Vaccine Type Description
MP	Mumps-only vaccine	MP	Mumps-only
MPRB or MPR	Mumps-Rubella-only vaccine	MB	Mumps-Rubella-only
RB	Rubella-only vaccine	RB	Rubella-only
ROT	Rotavirus-containing vaccine	RG	Rotarix® (GSK)
		RM	RotaTeq® (Merck)
		RO	Rotavirus, unknown type

7.8.1. Hib Up-To-Date Variables

A Hib vaccine shortage and interim recommendation to suspend the booster dose for healthy children occurred December 2007 to September 2009 (CDC 2010). Furthermore, the NIS-Child has historically considered children to be up-to-date for Hib if the child had 3 or more doses of any Hib-containing vaccine, but for some Hib vaccine product types, 4 doses are required. Because the NIS-Child has historically not distinguished between product types for Hib vaccine, children who received 3 doses of a vaccine product that required 4 doses were misclassified as up-to-date for Hib (CDC 2010).

Because of the Hib vaccine shortage and because of the dependence of the Hib recommendation on product type, in 2009 the IHQ was modified to capture the manufacturer of the Hib vaccinations the child has received. Beginning with the 2009 NIS-Child public-use data file, new up-to-date variables were added to indicate up-to-date status based on Hib recommendation (i.e., the primary series recommended during the shortage vs. the full series) and on the Hib manufacturer.

Table 7 shows the Hib up-to-date variables appearing on the public-use-date file beginning in 2009: in addition to the existing up-to-date indicator based on 3+ Hib of any type (**P_UTDHIB**), an indicator based on the "shortage" (i.e., primary series) recommendations accounting for manufacturer (3+ Hib of any type or 2+ Hib of Merck types) and an indicator based on the "routine" (i.e., full series) recommendations accounting for manufacturer (4+ Hib of any type or 2 Hib of Merck types followed by 1 Hib of any type) were added. Table 8 shows the up-to-date series variables that include Hib appearing

on the public-use-date file beginning in 2009: in addition to the existing vaccine series up-to-date variables based on 3+ Hib of any type (**PUTD4313**, **PUT43133**, **PU431331**, **PU4313313**, **PU4313314**), variables based on the "routine" (i.e., full series) Hib recommendations accounting for manufacturer (4+ Hib of any type or 2 Hib of Merck types followed by 1 Hib of any type) were added (**P_UTD431H_ROUT_S**, **P_UTD431H3_ROUT_S**, **P_UTD431H31_ROUT_S**, **P_UTD431H313_ROUT_S**, **P_UTD431H314_ROUT_S**).

Note that for these Hib up-to-date variables that account for the manufacturer, if the manufacturer is unknown because the provider failed to check a type box on the IHQ, it has been assumed that the manufacturer of the Hib vaccine is not Merck; that is, these variables are based on a "strict" treatment of Hib vaccinations of unknown type, erring on the side of classifying the child as not up-to-date.

Beginning with the 2010 NIS-Child public-use data file, two new vaccination series up-to-date indicators were added that ignore the Hib component altogether. These are **PU431_31** (indicates up-to-date status as measured by **PU431331**, but excluding the Hib component) and **PU431_314** (indicates up-to-date status as measured by **PU4313314**, but excluding the Hib component).

Table 7: Up-To-Date Variables for Hib, National Immunization Survey - Child, 2009-2017

Name	Description	Up-To-Date Criteria
P_UTDHIB	Historical UTD flag for Hib.	3+ of any type (07,43,44,D3,HG,HI,HM,HS,HY)
P_UTDHIB_SHORT_S	UTD flag for Hib-shortage (i.e., primary series) recommendation, accounting for manufacturer. Introduced in 2009.	3+ of any type (07,43,44,D3,HG,HI,HM,HS,HY) OR 2+ Merck types (HM,43)
P_UTDHIB_ROUT_S	UTD flag for routine (i.e., full series) Hib recommendation, accounting for manufacturer. Introduced in 2009.	4+ of any type (07,43,44,D3,HG,HI,HM,HS,HY) OR 2 Merck types (HM,43) followed by 1 of any type (07,43,44,D3,HG,HI,HM,HS,HY)

Table 8: Up-To-Date Variables for Vaccine Series Including Hib, National Immunization Survey - Child, 2009-2017

Name	Description
PUTD4313	UTD flag for the 4:3:1:3 series using the 3+ any type UTD definition for HIB
P_UTD431H_ROUT_S	UTD flag for the 4:3:1:3 series using the routine (i.e., full series) UTD definition for HIB
PUT43133	UTD flag for the 4:3:1:3:3 series using the 3+ any type UTD definition for HIB
P_UTD431H3_ROUT_S	UTD flag for the 4:3:1:3:3 series using the routine (i.e., full series) UTD definition for HIB
PU431331	UTD flag for the 4:3:1:3:3:1 series using the 3+ any type UTD definition for HIB
P_UTD431H31_ROUT_S	UTD flag for the 4:3:1:3:3:1 series using the routine (i.e., full series) UTD definition for HIB
PU4313313	UTD flag for the 4:3:1:3:3:1:3 series using the 3+ any type UTD definition for HIB
P_UTD431H313_ROUT_S	UTD flag for the 4:3:1:3:3:1:3 series using the routine (i.e., full series) UTD definition for HIB
PU4313314	UTD flag for the 4:3:1:3:3:1:4 series using the 3+ any type UTD definition for HIB
P_UTD431H314_ROUT_S	UTD flag for the 4:3:1:3:3:1:4 series using the routine (i.e., full series) UTD definition for HIB

7.8.2. Rotavirus Up-To-Date Variables

The up-to-date status for rotavirus vaccine depends on the manufacturer of the vaccines received; the requirement is two or more doses of Rotarix® (GSK) or three or more doses of rotavirus vaccine of any type. Beginning with the 2009 NIS-Child public-use data file, an up-to-date variable for rotavirus vaccine (**P_UTDROT_S**) was added to indicate up-to-date status, accounting for the manufacturer (3+ rotavirus doses of any type or 2+ Rotarix® doses).

Note that for this rotavirus up-to-date variable, if the manufacturer is unknown because the provider failed to check a type box on the IHQ, it has been assumed that the rotavirus vaccine dose is not Rotarix®; that is, this variable is based on a "strict" treatment of rotavirus vaccinations of unknown type, erring on the side of classifying the child as not up-to-date.

7.9. Section 9: Provider-Reported Age-At-Vaccination Variables

This section contains variables storing the child's age in days and months at each vaccination in the synthesized provider-reported vaccination history, along with the vaccine types of those vaccinations.

For each vaccine category, variables named **D*YYY*1 - D*YYY*9** and ***YYY*_AGE1 - *YYY*_AGE9** store the age in days and months, respectively, of the child when the vaccination was administered for up to nine vaccinations in the child's synthesized provider-reported vaccination history, where "YYY" is the vaccine category abbreviation given in Table 6. For vaccine categories that contain multiple vaccine types, variables **X*YYY*TY1 - X*YYY*TY9** give the corresponding vaccine type code (see Table 6).

Unlike the vaccination count and up-to-date variables in Section 8 of the public-use data file, the variables in Section 9 include vaccinations given both before and after the household interview was completed. If desired, users can limit the Section 9 variables to only those before the household interview date by examining the corresponding Section 8 "P_NUM" variable and limiting the analysis of the Section 9 variables to only the first *n* variables, where *n* is equal to the number of vaccinations in the vaccine category before the household interview date as indicated by the corresponding "P_NUM" variable.

Users of the public-use data file should be aware that the age-at-vaccination variables included in Section 9 may contain a small number of vaccination ages that are implausible according to the recommended immunization schedules (http://www.cdc.gov/vaccines/schedules/hcp/child-adolescent.html). Such ages may arise if a medical provider inadvertently records an erroneous vaccination date or if a vaccination date is incorrectly transcribed onto an IHQ. The quality control procedures of the NIS-Child address implausible ages to every extent possible. Suspicious dates are manually reviewed and corrected if there is evidence either from the household interview or from another provider that the date is incorrect. In rare cases, however, when there is no further information with which to correct the reported vaccination date, the vaccination is treated as having actually occurred and the implausible age at vaccination persists on the data file. The data user should consider these issues in deciding how to analyze the NIS-Child data.

7.10. Section 10: Health Insurance Module Variables

The Health Insurance Module (HIM) (Section E) was introduced in 2006 to gather information on the health insurance coverage of the child. HIM data were included in the NIS-Child public-use data file for the first time in 2007. Prior to 2016, seven variables containing HIM data were included in the NIS-Child public-use data file:

- INS_1 – "Is child covered by health insurance provided through employer or union?";
- INS_2 – "Is child covered by any MEDICAID plan?";
- INS_3 – "Is child covered by S-CHIP?";
- INS_3A – "Is child covered by any MEDICAID plan or S-CHIP?";
- INS_4_5 – "Is the child covered by Indian Health Service, Military Health Care, TRICARE, CHAMPUS, or CHAMP-VA?";
- INS_6 – "Is child covered by any other health insurance or health care plan?"; and
- INS_11 - "Anytime when child was not covered by health insurance?"

In 2016, these variables were replaced by two health insurance variables, INS_STAT_I and INS_BREAK_I, which summarize the child's health insurance status and history across all of the insurance questions listed above, while also incorporating the imputation of missing values and recoding of verbatim responses. **In 2017, INS_STAT_I was replaced with INS_STAT2_I, which provides a different categorization of children with both private and non-private, non-Medicaid insurance.**

INS_STAT2_I identifies the child's current health insurance coverage status. If the child has a form of private health insurance and is not covered by any other type of health insurance, he/she is classified as (1) Private only. If the child is on any form of Medicaid, alone or in addition to other forms of insurance, he/she is classified as (2) Any Medicaid. If the child is not covered by Medicaid but is covered by some other type of health insurance (including, but not limited to, CHIP, Indian Health Service, Military Health

Care, TRICARE, CHAMPUS, or CHAMP-VA), either alone or in combination with private insurance, he/she is classified as (3) Other. If the child is not covered by any kind of health insurance, he/she is classified as (4) Uninsured.

INS_BREAK_I describes the child's coverage history since birth and indicates whether there have been any breaks in coverage during this period. A child may be (1) currently insured but uninsured at some point since birth, (2) currently insured and never uninsured since birth, (3) currently uninsured but insured at some point since birth, or (4) currently uninsured and never insured since birth.

Both of these variables are only available for children with adequate provider data who live in the non-territory United States.

8. Analytic and Reporting Guidelines

Data from the NIS-Child public-use data file can be used to produce national, state, and estimation-area estimates of vaccination coverage using the **PROVWT_D** weight.

Information in the data file can also be used to calculate standard errors of the vaccination coverage estimates that reflect the complex sample design of the NIS-Child. The sample is stratified by the two sample frames and the 62 estimation areas. The stratum identifier (**STRATUM**) and the coded household identifier (**SEQNUMHH**) are key variables for obtaining standard errors for estimation area, state, and national estimates of vaccination coverage rates. The estimation area variable **ESTIAP17** defines mutually exclusive and exhaustive geographic areas, while **STRATUM** is a combination of the estimation area variable for that year and the sampling frame (landline or cell-phone).

Demographic and socioeconomic variables in the file can be used to obtain national vaccination coverage estimates for sub-groups of the population. Data users should, however, be aware that estimates for such sub-groups at the state or estimation area level will generally have large standard errors because of small sample sizes. The CDC standard for precision of sub-group estimates is that the ratio of the standard error

to the estimate should be less than or equal to 0.3, and each analytic cell should contain at least 30 respondents.

8.1. Use of NIS-Child Sampling Weights

The 2017 NIS-Child public-use data file contains two child-level weights. The **RDDWT_D** variable gives the household-phase weight for all children 19 through 35 months in the United States. These weights should be used to form estimates from children with completed household interviews. The weights reflect the stratified sample design and also have been adjusted for unit non-response, for the number of telephone lines in the household, for combining the landline and cell-phone samples, for post-stratification to population control totals, and for the exclusion of households without telephones.

The weight variable that applies to children with adequate provider data is **PROVWT_D**. These weights should be used to form estimates of vaccination coverage. Each child with adequate provider data (**PDAT** = 1) has a positive value for **PROVWT_D**. Starting with the 2002 file, the definition of children with adequate provider data was expanded to include unvaccinated children (as discussed in Section 2). Table 9 presents a summary of the appropriate weights and stratum variables to use for various types of analyses.

The 2017 NIS-Child public-use data file does not contain any provider-level weights. The NIS-Child does not sample providers directly; rather, they are included in the survey through the children they vaccinate. A user of the file should not attempt provider-level analyses (e.g., estimate the percentage of providers in the U.S. that are private providers), because the NIS-Child sample was not designed for that purpose.

Table 9: Summary of Weights and Stratum Variables, National Immunization Survey - Child, 2017

Weight Variable	Population*	Sample Frame	Strata	Stratum Variable
RDDWT_D	United States excluding territories	Dual Frame	Sample Type by Estimation Area	STRATUM
PROVWT_D	United States excluding territories, children with adequate provider data	Dual Frame	Sample Type by Estimation Area	STRATUM

***** Each weight will contain a missing value for all records that are not included in the population covered by the weight.

8.2. Estimation and Analysis

8.2.1. Estimating Vaccination Coverage Rates

Vaccination coverage rates are ratio estimators, as described in the statistical literature on methods for complex sample surveys. Because of the adjustment to the sampling weights for provider-phase non-response, statistical analyses require only data from children with adequate provider data (**PDAT** = 1), along with their final provider sampling weights (**PROVWT_D**). To summarize the statistical methodology by which vaccination coverage rates and their standard errors are obtained from these data, let Y_{hij} be an indicator, for the *j*th child with adequate provider data in the *i*th sampled household in the *h*th stratum of the NIS-Child sampling design, equal to 1 if the child is up-to-date according to the provider data and 0 otherwise. Also, let W_{hij} denote the value of **PROVWT_D** for this child. Then, letting $\hat{Y}_h = \sum_{i=1}^{n_h}\sum_{j=1}^{m_{hi}} W_{hij}Y_{hij}$ and $\hat{T}_h = \sum_{i=1}^{n_h}\sum_{j=1}^{m_{hi}} W_{hij}$, the national estimator of the vaccination coverage rate may be expressed as

$$\hat{\theta} = \frac{\sum_{h=1}^{L}\hat{Y}_h}{\sum_{h=1}^{L}\hat{T}_h}$$

where L denotes the number of strata, n_h denotes the number of sampled households containing children with adequate provider data in the hth stratum, and m_{hi} denotes the number of age-eligible children with adequate provider data in the ith household in the hth stratum.

Letting L instead denote the number of strata in a state, the above formula can also be used to calculate vaccination coverage rates for states (regardless of whether the state contains only one or more than one stratum).

8.2.2. Estimating Standard Errors of Vaccination Coverage Rates

The Taylor-series method can be used to estimate the sampling variance of vaccination coverage rates for the U.S., the states, and estimation areas. Letting $Z_{hij} = \frac{W_{hij}(Y_{hij} - \hat{\theta})}{\sum_{h=1}^{L} \hat{T}_h}$, $Z_{hi} = \sum_{j=1}^{m_{hi}} Z_{hij}$, and $\overline{Z}_h = \frac{\sum_{i=1}^{n_h} Z_{hi}}{n_h}$ yields an estimator of the variance of the estimated vaccination coverage rate, $\hat{\theta}$, equal to

$$v(\hat{\theta}) = \sum_{h=1}^{L} \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} (Z_{hi} - \overline{Z}_h)^2$$

(Wolter, 2007). The standard error is the square root of the variance. The estimation of standard errors for estimates of vaccination coverage rates in the NIS-Child can be implemented in specialized statistical software such as SUDAAN (Research Triangle Institute 2008), SAS (SAS Institute Inc. 2003), R (Lumley, 2010), and Stata (Stata Corporation 2009). Appendix D gives several examples of the use of SAS, R, and SUDAAN to estimate vaccination coverage rates and their standard errors for estimation areas and states. For all procedures, the option of with-replacement sampling of primary sampling units within strata is used, because the sampling fractions for households within an estimation area are all quite small. For all estimates, the variable **STRATUM** is used as the stratum variable and the household identifier (**SEQNUMHH**) is used as the primary sampling unit identifier. The data file should be sorted first on **STRATUM** and then on **SEQNUMHH** before running the programs for SUDAAN and SAS.

8.3. Combining Multiple Years of NIS-Child Data

8.3.1. Estimation of Multi-Year Means

With release of the 2017 NIS-Child public-use data file, 22 years of public-use NIS-Child data are now available. The precision of estimates of vaccination coverage for sub-domains (e.g., by race/ethnicity of child) within estimation areas or states can be improved by combining two or more years of NIS-Child data. Data users should, however, be aware that estimates from combined years of NIS-Child data represent an average over two or more years. Although combining several years of NIS-Child data will yield a larger sample size for estimation areas and states, the composition of the population in a geographic area may change over time, making interpretation of the results difficult. Furthermore, if vaccination administration schedules or vaccination coverage changes over time, the estimate of vaccination coverage for the combined time period applies to a hypothetical population that existed at the middle of the time period, making interpretation of the results even more difficult. Given the use of independent RDD samples in the NIS-Child, it is also possible that a child could appear in more than one public-use data file.

To estimate a multi-year mean for a given NIS-Child variable, the weights in each participating file (RDD-phase weights HY_WGT in 1995-2001, RDD_WT in 2002, WGT_RDD in 2003-2004, RDDWT in 2005-2010, RDDWT_D/RDDWT_LL in 2011, RDDWT_D/RDDWTVI_D in 2012, RDDWT_D/RDDWTVIGU_D in 2013, RDDWT_D/RDDWT_D_TERR in 2014-2016, and RDDWT_D in 2017**;** and provider-phase weights W0 in 1995-2001, WT in 2002, WGT in 2003-2004, PROVWT in 2005-2010, PROVWT_D/PROVWT_LL in 2011, PROVWT_D/PROVWTVI_D in 2012, PROVWT_D/PROVWTVIGU_D in 2013, PROVWT_D/PROVWT_D_TERR in 2014-2016, and PROVWT_D in 2017) should be divided by the number of years being combined. For example, if data for 2015, 2016, and 2017 for children in the United States (excluding territories) with adequate provider data are to be combined, then the weights that exclude the territories in the three files – called **PROVWT_D** in 2015-2017 – should be divided by 3 to obtain revised weights, which should be saved as a new variable,

say **NEWWT**. It is necessary to use **NEWWT** in the analysis to obtain correct weighted estimates for children aged 19 through 35 months. Furthermore, the child and household ID numbers (**SEQNUMC** and **SEQNUMHH**) in the files are unique only within a year, not across years. It is important for the user to create revised, unique ID numbers when combining data from multiple years.

The following SAS code can be used:

YRSEQC = 1 * (**YEAR** || **SEQNUMC**);

YRSEQHH = 1 * (**YEAR** || **SEQNUMHH**);

YEAR is the 4-digit year variable for the NIS-Child data year (e.g., 2017).

To produce valid estimates of sampling variability and valid confidence intervals for multi-year coverage rates and other multi-year means, it is necessary to use specialized software such as SAS or SUDAAN.

The years 2005 to 2017 bring an important new complication for variance estimation not encountered in previous NIS-Child years, because some traditional estimation areas were removed and other new areas were defined and introduced to the survey (see Section 2 above for more information about rotating estimation areas). The variance strata for 2004 and all prior years are defined by the variable **ITRUEIAP**, while the variance strata for 2005-2017 are defined by the variables **ESTIAP** for 2005, **ESTIAP06** for 2006, **ESTIAP07** for 2007, **ESTIAP08** for 2008, **ESTIAP09** for 2009, **ESTIAP10** for 2010, **STRATUM_D/ESTIAP11** for 2011, and **STRATUM** for 2012-2017, with **STRATUM_D** and **STRATUM** being a combination of the estimation area variable for that year and the sampling frame (landline or cell-phone). The estimation area variables **ITRUEIAP**, **ESTIAP**, and **ESTIAP06-ESTIAP17** define mutually exclusive and exhaustive geographic areas. However, they are not exactly the same areas. **For example, Dallas County, TX, was a separate estimation area in 2005-2012 and 2016-2017 but not in 2013-2015. Other areas, such as New York City, NY and Rest of New York, are estimation areas in all years, including 2005-2017.**

To make inferences concerning multi-year means, the user must take two actions. First, he/she must define and save a new stratum variable with a common name for all years included in the analysis. Second, he/she must define a common set of estimation domains that can be supported by each of the files included in the multi-year analysis. To take these actions, the user should follow the following seven-step procedure (or its equivalent):

i. Compute and save the new, common variance-stratum variable for each year participating in the analysis. The variable should be defined by the equation

STRATUMV = **ITRUEIAP**, for children in the 2004 or prior years' public-use data files

= **ESTIAP**, for children in the 2005 public-use data file

= **ESTIAP06**, for children in the 2006 public-use data file

= **ESTIAP07**, for children in the 2007 public-use data file

= **ESTIAP08**, for children in the 2008 public-use data file

= **ESTIAP09**, for children in the 2009 public-use data file

= **ESTIAP10**, for children in the 2010 public-use data file

= **STRATUM_D** if using **PROVWT_D** or

ESTIAP11 if using **PROVWT_LL**, for children in the 2011 public-use data file

= **STRATUM**, for children in the 2012-2017 public-use data files

ii. Compute and save the new, common weight variable, **NEWWT**, as instructed above for each year participating in the analysis.

iii. Compute and save the new, unique child and household identification numbers, **YRSEQC** and **YRSEQHH**, as instructed above for each year participating in the analysis.

iv. Compute and save a variable defining the common estimation domains to be studied for each year participating in the analysis. For example, one could use the CDIAP (Common Denominator Estimation Area) variable set forth in Table 10 or states as geographic domains.

v. Merge the multiple files into one consolidated file in a format compatible with the specialized software to be used.

vi. Sort the consolidated file by **YEAR**, **STRATUMV**, and **YRSEQHH**.

vii. Run the specialized software on the consolidated file, computing estimates, variance estimates, and confidence intervals. For SUDAAN users, sampling levels or stages may be specified by the statement

NEST YEAR STRATUMV YRSEQHH / PSULEV = 3;

the specification of weights by

WEIGHT NEWWT;

and the specification of estimation domains, for example, by the two statements

```
CLASS YEAR CDIAP STATE;
TABLES CDIAP;
```

or

```
CLASS YEAR CDIAP STATE;
TABLES STATE;
```

8.3.2. Estimation of Multi-Year Contrasts

Considerations similar to those for multi-year means arise in the estimation of contrasts between NIS-Child years. For example, a typical contrast of interest would be the difference between the immunization coverage parameters in 2016 and in 2017.

To make inferences concerning a multi-year contrast, the user will need to work with the original weights reported on the files and store them in a common variable. One must not divide the original weights by the number of years included in the contrast. For example, one may define the new, common weight variable as

NEWWT2 = **PROVWT_D/PROVWT_LL** , if the child is in the 2011 PUF.

= **PROVWT_D** , if the child is in the 2012-2017 PUF.

The user should follow the seven-step procedure set forth in the section on multi-year means, using **NEWWT2** in lieu of **NEWWT**. In SUDAAN, the user should also specify the contrast of interest through use of a CONTRAST statement or an appropriate regression model. For example, to compare the 4:3:1:3:3:1 up-to-date estimate from 2016 to the 2017 estimate, SUDAAN users can use the following WEIGHT, VAR, and CONTRAST statements:

```
WEIGHT NEWWT2;
VAR PU431331;
CONTRAST YEAR = (-1 1);
```

***** The estimation area WA-Eastern WA was introduced in 2006, and while this estimation area also existed in 2010, the county definition of the area changed, making cross-year comparisons inadvisable. The estimation area WA-Western WA, introduced in 2007, presents the same issue. The counties included in the area changed (e.g., in 2010 it included King County). Analysis of Washington state data across years should use the entire state as the "Common Denominator".

9. Summary Tables

Appendix F contains seven tables. Appendix Table F.1 lists the 62 estimation areas for the 2017 NIS-Child by state. At the national level and for each state and estimation area, it provides the estimated population total of children aged 19 through 35 months of age in 2017, and (from 2017 NIS-Child data collection) the number of children with completed household interviews and number of children with adequate provider data.

Appendix Tables F.2 through F.6 summarize pairs of variables: age group of child by maternal education (Appendix Table F.2), age group by family poverty status (Appendix Table F.3), race/ethnicity by family poverty status (Appendix Table F.4), age group by race/ethnicity (Appendix Table F.5), and age group by sex (Appendix Table F.6). Each of these tables gives the unweighted and weighted counts of children who have completed household interviews and the unweighted and weighted counts of children with adequate provider data.

Appendix Table F.7 presents estimates of vaccination coverage and symmetric 95% confidence intervals obtained from SUDAAN. The data user should obtain the same estimates from the 2017 NIS-Child public-use data file.

Appendix G contains four tables and time-series charts. Table G.1 and Figure G.1 show key components of the NIS-Child response rates and the CASRO response rates for the landline sample by year of the survey. Table G.2 and Figure G.2 show key components of the NIS-Child response rates and the CASRO response rates for the cell-phone sample by year of the survey. Table G.3 and Figure G.3 show the CASRO response rates for the combined landline and cell-phone samples. Table G.4 and Figure G.4 show vaccination coverage estimates since 1995.

Appendix H shows the vaccine type codes used in the 2017 NIS-Child public-use data file.

Appendix I presents key response rate components and the overall CASRO response rate by estimation area in the 2017 NIS-Child landline and cell-phone samples.

10. Assessment of Total Survey Error

Assessing the validity of the NIS-Child estimates of vaccination coverage is a critical and ongoing aspect of the NIS-Child surveillance program. CDC frequently conducts evaluation studies and controlled experiments to understand the causes and impacts of sampling and nonsampling errors on the estimates and to enable formulation of methodological refinements that have the demonstrated capacity to improve data quality. As landline phone use decreased and cell phone use increased dramatically over the past decade, and the NIS-Child transitioned from a single-frame landline RDD sampling design to a dual-frame landline and cell phone RDD design, CDC has monitored the NIS-Child estimates utilizing a Total Survey Error (TSE) approach.

TSE is the sum of the errors that arise at every step of a survey, including both sampling error and nonsampling errors such as coverage, nonresponse, and measurement errors (Mulry and Spencer, 1991). Pooling information from multiple evaluations of their precision and accuracy, we have conducted TSE analyses for the 2009-2013 NIS-Child and NIS-Teen data (Molinari et al. 2011; NORC 2011; Pineau et al. 2012; Pineau et al. 2013; Skalland et al. 2016; Wolter et al. 2017b), including components for

coverage error, nonresponse error, and sampling error. Figure 1 charts the estimated mean total error for 2009-2013 NIS-Child vaccination coverage rate estimators using the base/design weights (i.e., unadjusted for nonresponse and not calibrated to population totals) and using the final weights. For the 4:3:1:3:3:1 vaccine series, ≥1 MMR, and ≥4 DTaP, total error is smaller in 2010-2013 than in 2009. For 2013, final weights appear to reduce error relative to the design weights for the 4:3:1:3:3:1 series and 4+ DTaP vaccination coverage rate estimators but not for 1+ MMR.

For 2012 and 2013, the TSE model was extended to include a form of measurement error called "provider under-reporting" error, in addition to the coverage and nonresponse error components previously included in the model (Wolter et al. 2017b). Sometimes also called "under-ascertainment," provider under-reporting error arises when a child with adequate provider data is truly vaccinated but is reported as unvaccinated in the child's provider-reported vaccination history. Under-reporting error can occur if the household respondent fails to nominate all of the child's vaccination providers, if one or more of the child's nominated vaccination providers fails to report a vaccination history for the child, or if one or more of the child's nominated providers reports a vaccination history but fails to report all of the vaccinations the child has received. Figure 2 presents the estimated mean total error for 2012-2013 NIS-Child vaccination coverage rate estimators, including components for coverage error, nonresponse error, under-reporting error, and sampling error, using the design weights and using the final weights. The addition of under-reporting error into the TSE model results in negative estimates of TSE for both 2012 and 2013 for the two vaccines and the vaccine series; that is, the results suggest that the NIS-Child vaccination coverage rate estimates may be lower than the true vaccination coverage rates for these vaccines and this series, and that the total error is largely due to under-reporting error.

Figure 1: Comparison of Estimated Mean Total Error for 4:3:1:3:3:1 Series, ≥1 MMR, and ≥4 DTaP by Survey Year, Including Components for Coverage Error, Nonresponse Error, and Sampling Error, National Immunization Survey - Child, 2009-2013

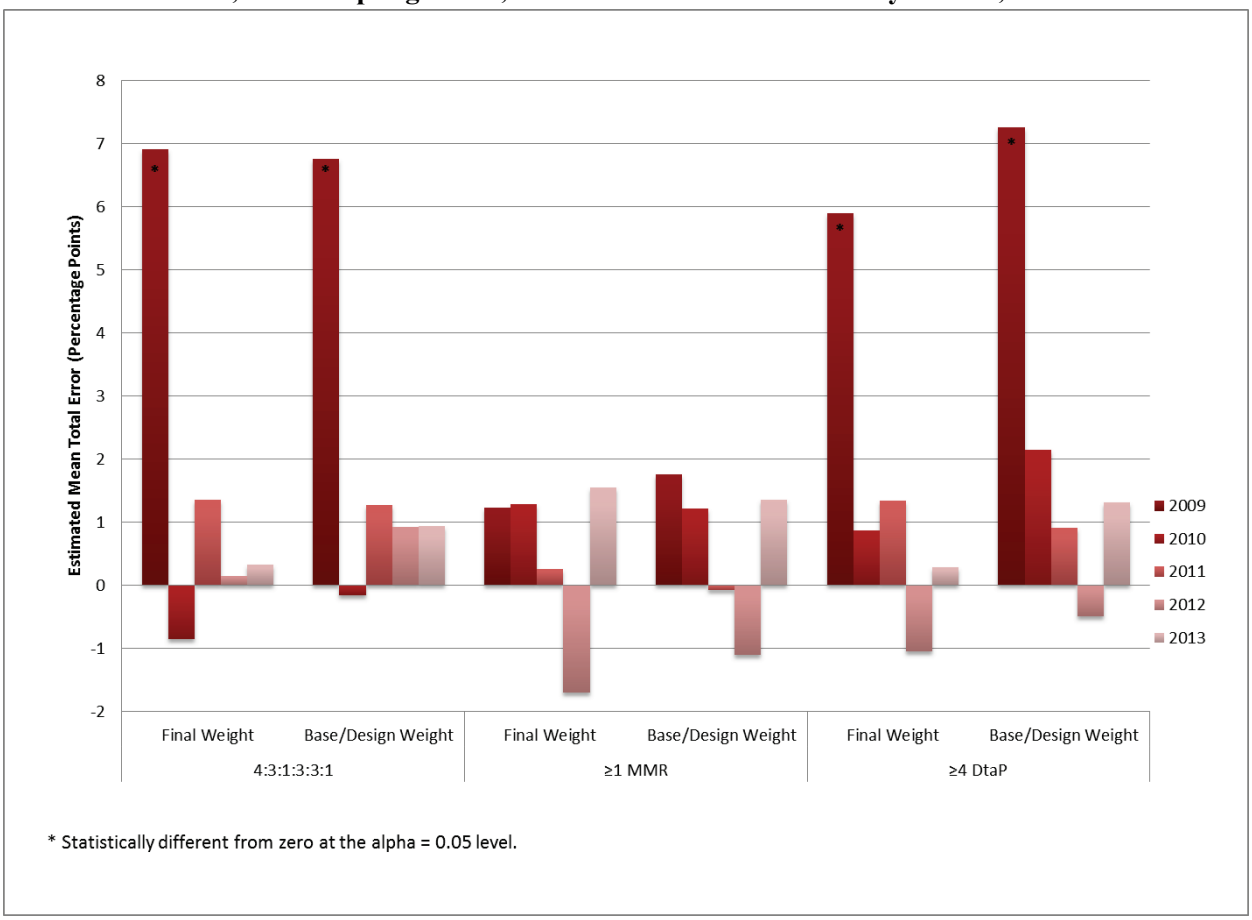

Figure 2: Comparison of Estimated Mean Total Error for 4:3:1:3:3:1 Series, ≥1 MMR, and ≥4 DTaP by Survey Year, Including Components for Coverage Error, Nonresponse Error, Under-Reporting Error, and Sampling Error, National Immunization Survey - Child, 2012-2013

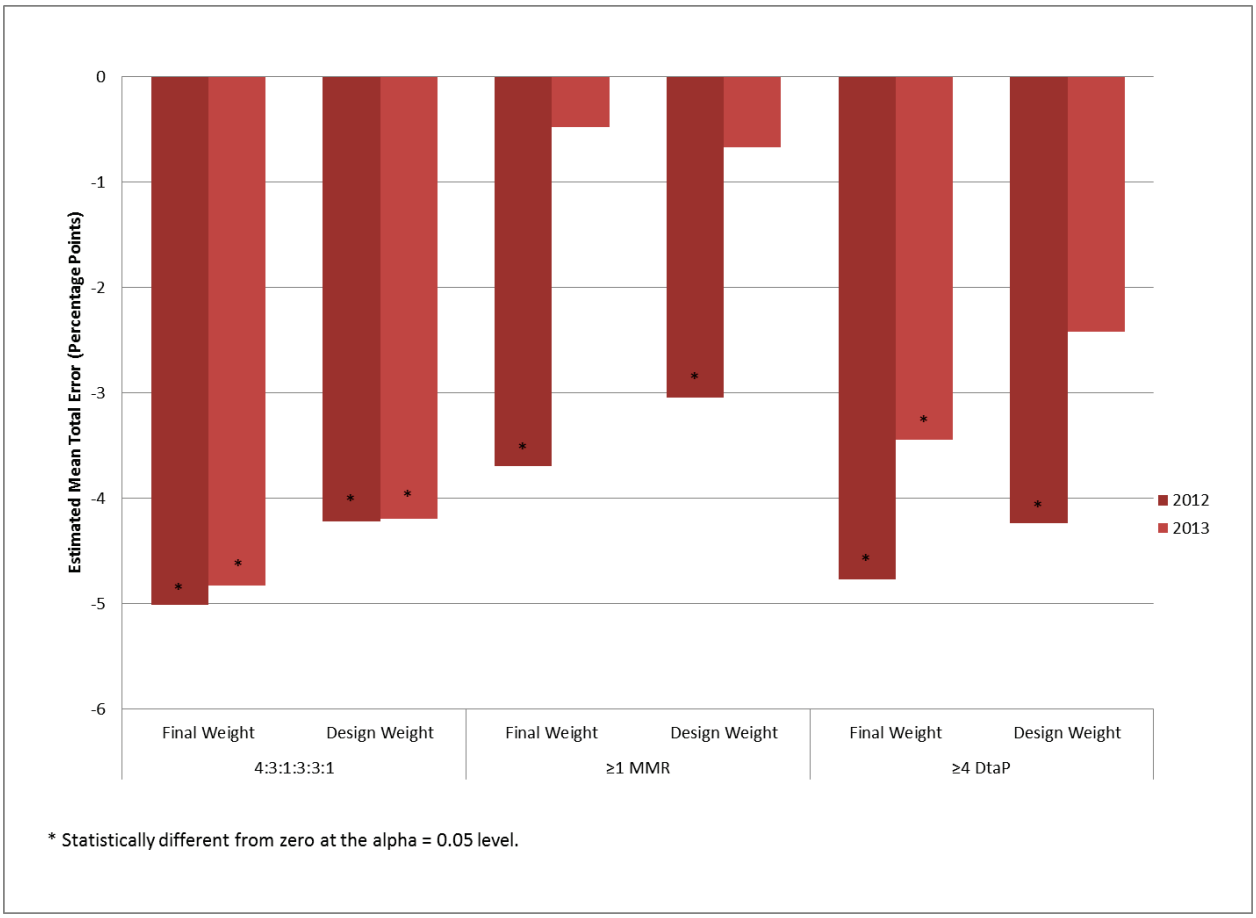

11. Limitations

The findings in this report are subject to at least four limitations. First, because NIS-Child is a telephone survey, results are weighted to be representative of all children aged 19 through 35 months. Although statistical adjustments were made to account for non-response and households without telephones, some bias might remain. Second, underestimates of vaccination coverage might have resulted from the exclusive use of provider-reported vaccination histories because completeness of these records is unknown. Third, although national estimates of vaccination coverage are precise, estimates for state and local areas should be interpreted with caution because their sample sizes are smaller and their confidence intervals generally are wider than those for national estimates. Finally, analysis of trends across data years that span from 2010 and earlier to 2011-2017 are subject to potential bias that may remain after weighting adjustments because of the switch from landline to dual landline and cell-phone sample frames in 2011. In addition, analysis of trends across data years that span from 2011 to 2017 are subject to potential bias that may remain after weighting adjustments because of the expansions and reductions of the share of the total sample that came from the cell-phone frame across these years.

In Biemer, P., De Leeuw, E., Edwards, B., Kreuter, F., Lyberg, L., Tucker, C., and West, B. (Eds.) *Total Survey Error in Practice*, John Wiley & Sons, Inc., Hoboken, NJ, USA.

Zell, E.R., Ezzati-Rice, T.M., Battaglia, M.P., and Wright, R.A. (2000). National Immunization Survey: The methodology of a vaccination surveillance system. *Public Health Reports*, 115(1):65-77.

Appendix A: Glossary of Abbreviations and Terms

3:3:1	The series of 3 or more DTaP vaccinations, 3 or more polio vaccinations, and 1 or more MCV vaccinations
4:3:1	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, and 1 or more MCV vaccinations
4:3:1:3	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, and 3 or more Hib vaccinations of any type
4:3:1:3* (routine Hib)	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, and 3 or 4 Hib vaccinations depending on manufacturer (routine recommendation)
4:3:1:3:3	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or more Hib vaccinations of any type, and 3 or more hepatitis B vaccinations
4:3:1:3*:3 (routine Hib)	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or 4 Hib vaccinations depending on manufacturer (routine recommendation), and 3 or more hepatitis B vaccinations
4:3:1:3:3:1	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or more Hib vaccinations of any type, 3 or more hepatitis B vaccinations, and 1 or more varicella vaccinations given at age 12 months or older
4:3:1:3*:3:1 (routine Hib)	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or 4 Hib vaccinations depending on manufacturer (routine recommendation), 3 or more hepatitis B vaccinations, and 1 or more varicella vaccinations given at age 12 months or older
4:3:1:3:3:1:3	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or more Hib vaccinations of any type, 3 or more hepatitis B vaccinations, 1 or more varicella vaccinations given at age 12 months or older, and 3 or more pneumococcal vaccinations
4:3:1:3*:3:1:3 (routine Hib)	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or 4 Hib vaccinations depending on manufacturer (routine recommendation), 3 or more hepatitis B vaccinations, 1 or more varicella vaccinations given at age 12 months or older, and 3 or more pneumococcal vaccinations
4:3:1:3:3:1:4	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or more Hib vaccinations of any type, 3 or more hepatitis B vaccinations, 1 or more varicella vaccinations given at age 12 months or older, and 4 or more pneumococcal vaccinations

4:3:1:3*:3:1:4 (routine Hib)	The series of 4 or more DTaP vaccinations, 3 or more polio vaccinations, 1 or more MCV vaccinations, 3 or 4 Hib vaccinations depending on manufacturer (routine recommendation), 3 or more hepatitis B vaccinations, 1 or more varicella vaccinations given at age 12 months or older, and 4 or more pneumococcal vaccinations
CATI	Computer-assisted telephone interviewing
CDC	Centers for Disease Control and Prevention
CII	Childhood Immunization Initiative
DOB	Date of birth
DTaP	Diphtheria and tetanus toxoids and acellular pertussis vaccine adsorbed
DTP	Diphtheria and tetanus toxoids and pertussis vaccine
DT	Diphtheria and tetanus toxoids adsorbed
H1N	Monovalent 2009 H1N1 influenza
Hep A	Hepatitis A vaccine
Hep B	Hepatitis B vaccine
Hib	*Haemophilus influenzae* type b conjugate vaccine
Hib routine recommendation	Four or more doses of Hib vaccine of any type, or two or more doses of Hib vaccine of Merck types followed by one dose of Hib vaccine of any type
Hib shortage recommendation	Three or more doses of Hib vaccine of any type or two or more doses of Hib vaccine of Merck types
IAP	Immunization Action Plan
IHQ	Immunization history questionnaire
IPV	Inactivated poliovirus vaccine
MCV	Measles-containing vaccine
MMR	Measles, mumps, and rubella vaccine
NCHS	National Center for Health Statistics
NCIRD	National Center for Immunization and Respiratory Diseases
NIS	National Immunization Surveys

NIS-Child	National Immunization Survey-Child
NHIS	National Health Interview Survey
NIP	National Immunization Program
OPV	Oral poliovirus vaccine
PCV	Pneumococcal conjugate vaccine
PRC	Provider Record Check
PUF	Public-use (Data) File
RDD	Random digit dialing
RV	Rotavirus
SC	Shot card
UTD	Up-to-date
VFC	Vaccines for Children
VAR	Varicella vaccine

Appendix B: Summary Statistics for Sampling Weights by Estimation Area

Table B.1: Distribution of Dual-Frame Sampling Weights* for Children with Completed Household Interviews, National Immunization Survey - Child, 2017

State/Estimation Area	n	Sum	Minimum	Maximum	Mean	Coefficient of Variation
U.S. National†	28,465	5,777,734.93	2.90	6,240.05	202.98	160.83

Appendix C: Flags for Inconsistent Values in the Breastfeeding Data

Two different types of inconsistency can arise in breastfeeding data. The first is that the duration of any breastfeeding can exceed the age of the child, and the second is that the age of the child when first fed formula can exceed the age of child. BF_ENDR06 stores the duration of any breastfeeding, and BF_ENDFL06 flags the inconsistency; BF_FORMR08 stores the age of the child when first fed formula, and BF_FORMFL06 flags the inconsistency.

1. **Both BF_ENDR06 and BF_FORMR08 are formulated using the following conversion factors:**

   if unit=1(days) then BF_ENDR06 = number x 1
   if unit=2(weeks) then BF_ENDR06 = number x 7
   if unit=3(months) then BF_ENDR06 = number x 30.4375
   if unit=4(years) then BF_ENDR06 = number x 365.25

   if unit=1(days) then BF_FORMR08 = number x 1
   if unit=2(weeks) then BF_FORMR08 = number x 7
   if unit=3(months) then BF_FORMR08 = number x 30.4375
   if unit=4(years) then BF_FORMR08 = number x 365.25

2. **Flagging BF_ENDR06 when the duration of any breastfeeding exceeds the age in days with a buffer for different units:**

   if unit=1(days) flag when BF_ENDR06 > age + 1
   if unit=2(weeks) flag when BF_ENDR06 > age + 3
   if unit=3(months) flag when BF_ENDR06 > age + 15
   if unit=4(years) flag when BF_ENDR06 > age + 182

The different buffers allow for the impact of rounding durations upward in the specified units (for example, 50 days might be reported as 2 months).

3. **Flagging BF_FORMR08 when the age when first fed formula exceeds the age in days with a buffer for different units:**

   if unit=1(days) flag when BF_FORMR08 > age + 1
   if unit=2(weeks) flag when BF_FORMR08 > age + 3
   if unit=3(months) flag when BF_FORMR08 > age + 15
   if unit=4(years) flag when BF_FORMR08 > age + 182

The different buffers allow for the impact of rounding durations upward in the specified units (for example, 50 days might be reported as 2 months).

Appendix D: Programs for Estimation: Examples of the Use of SUDAAN, SAS, and R to Estimate Vaccination Coverage Rates and Their Standard Errors, and an Example of the Production of a Cross-Tabulation and Chart

A. SUDAAN

```

Appendix E: Alphabetical Listing of Variables that are in the 2004-2017 Public-Use Data Files

Table E.1 Alphabetical Listing of Variables that are in the 2004-2017 Public-Use Data Files*

		Year of Data Collection														
Variable Name	**Variable Label†**	**2004**	**2005**	**2006**	**2007**	**2008**	**2009**	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**	**2016**	**2017**	**Notes§**
AGECPOXR	AGE IN MONTHS AT CHICKEN POX DISEASE (RECODE)		Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Replaced IAGECPXR starting 2005. This version is not imputed.
AGEGRP	AGE CATEGORY OF CHILD (19-23, 24-29, 30-35 MO) (RECODE)	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
ALL4SHOT	HH REPORT OF 4:3:1:3 UP-TO-DATE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
BF_ENDR	DURATION OF BREASTFEEDING IN DAYS (TOPCODE)	Y	Y													Dropped starting in 2006 because of question wording change. Replaced by BF_ENDR06.
BF_ENDR06	DURATION OF BREASTFEEDING IN DAYS (RECODE)			Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Replaced BF_ENDR starting 2006.
BF_EXCLR	DURATION OF EXCLUSIVE BREASTFEEDING IN DAYS (TOPCODE)	Y	Y													Dropped starting in 2006 because of question wording change. Replaced by BF_EXCLR06.
BF_EXCLR06	DURATION OF EXCLUSIVE BREAST/FORMULA FEEDING IN DAYS (RECODE)			Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Replaced BF_EXCLR starting 2006.
BF_FORMR06	AGE IN DAYS WHEN CHILD FIRST FED FORMULA (TOPCODE)			Y	Y											Question CBF_03_X added starting 2006. Replaced by BF_FORMR06 starting 2008.
BF_FORMR08	AGE IN DAYS WHEN CHILD FIRST FED FORMULA (RECODE)					Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Replaced BF_FORMR06 to add a "never fed formula" code.
BFENDFL	DURATION OF BREAST FEEDING EXCEEDS CHILD AGE IN DAYS, WITH BUFFER	Y	Y													Dropped starting in 2006 because of question wording change. Replaced by BFENDFL06.
BFENDFL06	DURATION OF BREAST FEEDING EXCEEDS CHILD AGE IN DAYS, WITH BUFFER			Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Replaced BFENDFL starting 2006.
BFEXCLFL	DURATION OF EXCLUSIVE BREAST FEEDING EXCEEDS TOTAL BREASTFEEDING, WITH BUFFER	Y	Y													Dropped starting in 2006 because question wording change does not allow it to be derived.
BFFORMFL06	AGE IN DAYS WHEN CHILD FIRST FED FORMULA EXCEEDS CHILD AGE IN DAYS, WITH BUFFER			Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Question CBF_03_X added starting 2006.
C_431	HH REPORT OF 4:3:1 UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C_4313	HH REPORT OF 4:3:1:3 UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.

Variable Name	Variable Label[†]	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	Notes[§]
C_DTP	HH REPORT OF 4+ DT-CONTAINING UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C_HEP	HH REPORT OF 3+ HEPATITIS B-CONTAINING UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C_HIB	HH REPORT OF 3+ HIB-CONTAINING UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C_MMR	HH REPORT OF 1+ MEASLES-CONTAINING UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C_POL	HH REPORT OF 3+ POLIO-CONTAINING UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C_VRC	HH REPORT OF 1+ VARICELLA-CONTAINING UP-TO-DATE BY SHOT CARD USE	Y	Y													Dropped starting in 2006 because no longer possible to derive due to questionnaire change.
C1R	NUMBER OF PEOPLE IN HOUSEHOLD (RECODE)	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
C5R	RELATIONSHIP OF RESPONDENT TO CHILD (RECODE)	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
CBF_01	WAS CHILD EVER BREASTFED OR FED BREAST MILK?	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
CEN_REG	CENSUS REGION BASED ON TRUE STATE OF RESIDENCE	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
CHILDNM	NUMBER OF CHILDREN LESS THAN 18 YEARS IN HH (RECODE)	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
CWIC_01	CHILD EVER RECEIVED WIC BENEFITS?	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
CWIC_02	CHILD CURRENTLY RECEIVING WIC BENEFITS?	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
D6R	NUMBER OF VACCINATION PROVIDERS IDENTIFIED BY RESPONDENT (RECODE)	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
D7	CONSENT TO OBTAIN CHILD'S IMMUNIZATION RECORDS FROM PROVIDERS	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP1	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #1	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP2	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #2	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP3	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #3	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP4	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #4	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	

Variable Name	Variable Label[†]	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	Notes[§]
DDTP5	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #5	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP6	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #6	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP7	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #7	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP8	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #8	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DDTP9	AGE IN DAYS OF PROV-REPTD DT-CONTAINING SHOT #9		Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Starting in 2005, nine shot variables are included for each vaccine category.
DFLU1	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #1	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU2	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #2	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU3	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #3	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU4	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #4	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU5	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #5	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU6	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #6	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU7	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #7	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU8	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #8	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DFLU9	AGE IN DAYS OF PROV-REPTD SEASONAL FLU-CONTAINING VACCINATION #9		Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Starting in 2005, nine shot variables are included for each vaccine category.
DH1N1	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #1							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N2	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #2							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.

Variable Name	Variable Label[†]	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	Notes[§]
DH1N3	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #3							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N4	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #4							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N5	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #5							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N6	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #6							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N7	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #7							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N8	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #8							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DH1N9	AGE IN DAYS OF PROV-REPTD MONOVALENT 2009 H1N1 INFLUENZA VACCINATION #9							Y	Y	Y						H1N1 influenza added to the IHQ shotgrid starting in late 2009, and introduced in the PUF in 2010. Removed from the IHQ and the PUF in 2013.
DHEPA1	AGE IN DAYS OF PROV-REPTD HEPATITIS A-CONTAINING SHOT #1	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DHEPA2	AGE IN DAYS OF PROV-REPTD HEPATITIS A-CONTAINING SHOT #2	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DHEPA3	AGE IN DAYS OF PROV-REPTD HEPATITIS A-CONTAINING SHOT #3	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DHEPA4	AGE IN DAYS OF PROV-REPTD HEPATITIS A-CONTAINING SHOT #4	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DHEPA5	AGE IN DAYS OF PROV-REPTD HEPATITIS A-CONTAINING SHOT #5	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	
DHEPA6	AGE IN DAYS OF PROV-REPTD HEPATITIS A-CONTAINING SHOT #6	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y

* For a list of variables that appeared in one or more (but not all) NIS-Child public-use data files from 1995-2004, see "Alphabetical Listing of Variables that are Not Available in All Public-Use Data Files, National Immunization Survey, 1995-2004": http://www.cdc.gov/nchs/data/nis/pufvariables1995to2004.pdf

† If the variable appeared in the 2017 NIS-Child public-use data file, then the 2017 label is given; otherwise the label from the most recent NIS-Child public-use data file in which the variable appeared is given.

§ Starting in 2005, a code of 77 is used for "Don't Know" responses and a code of 99 is used for "Refused" responses.

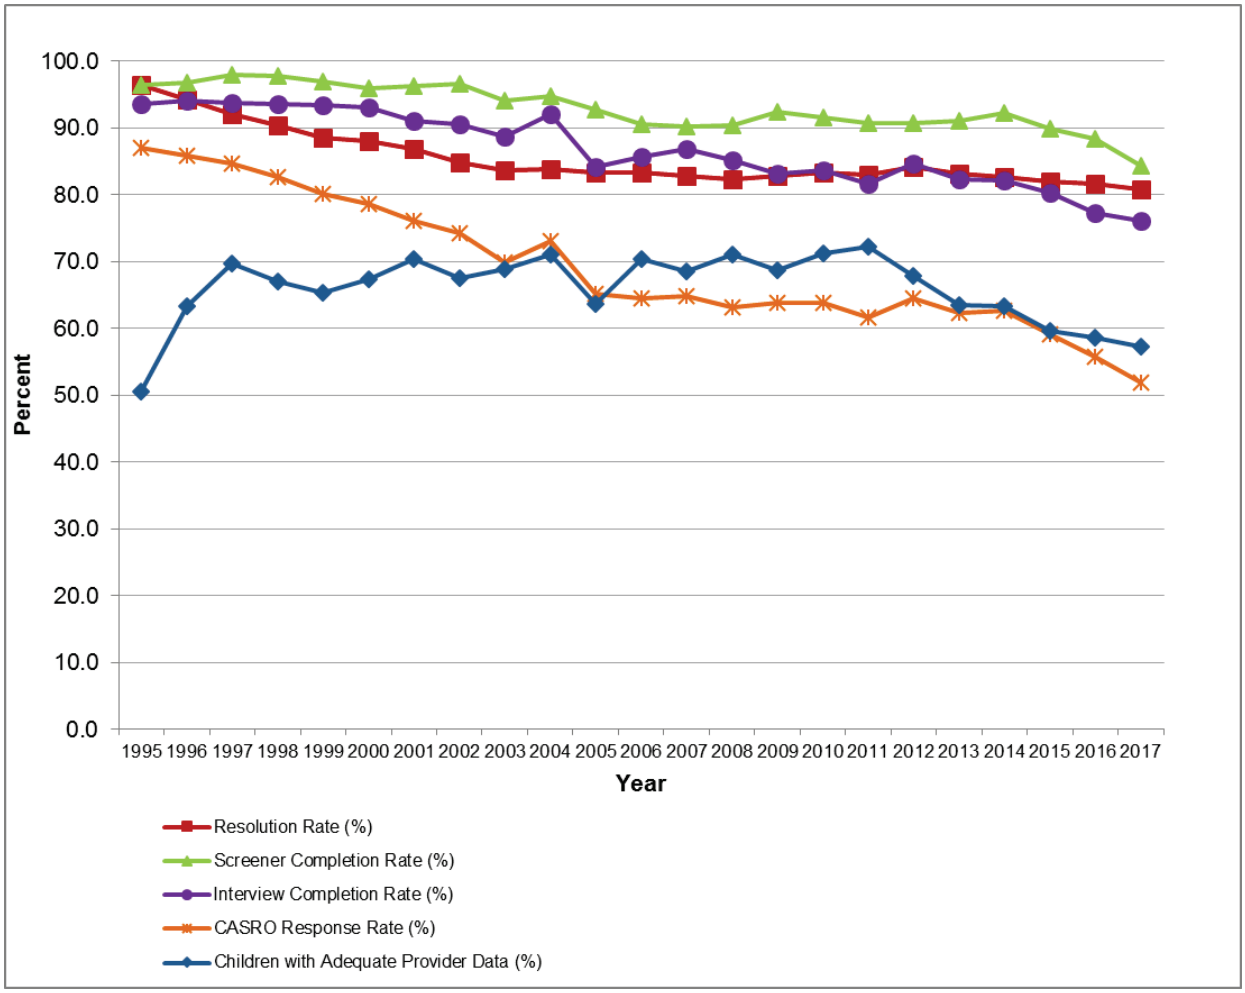
***** For the definition of the key indicators see Table 1 of NIS-Child Data User's Guide for the survey year of interest.

† Excludes U.S. territories.

Figure G.1: Trends in Landline Sample Key Indicators from Household and Provider Data Collection by Survey Year, National Immunization Survey - Child, 1995-2017*



* Excludes U.S. territories.

Figure G.1 provides a graphical representation of the data contained in Table G.1. It shows how selected landline sample key indicators from the household and provider data collection performed throughout the years, from 1995 to present. We observe that the trend in the data collection rates is downward, with the exception of the percentage of children with adequate provider data, which had been essentially flat from 1997-2012, but also trending downward since 2013. Note that this chart reflects the landline sample only.

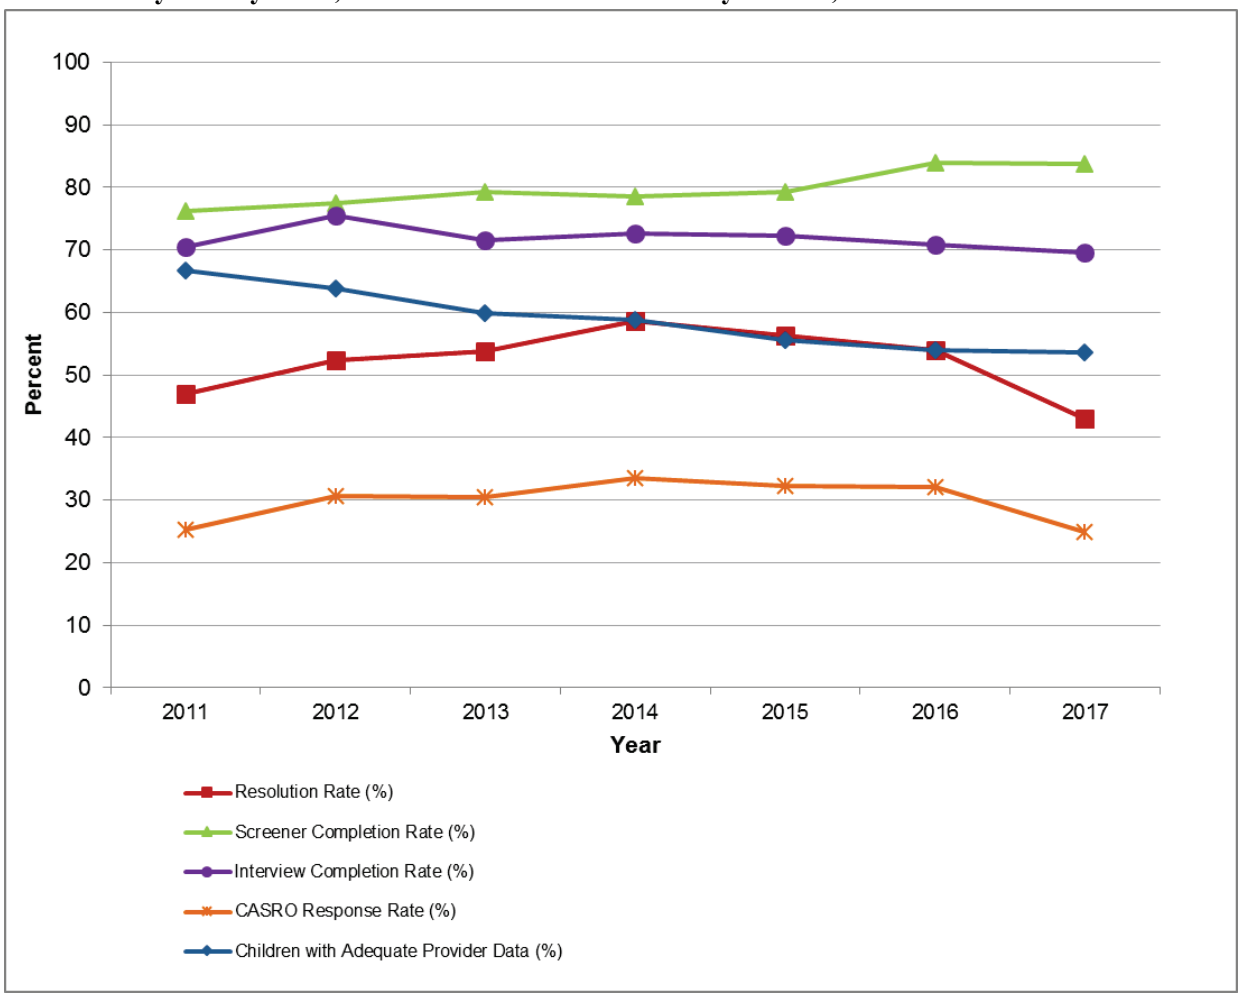
Table G.2: Key Indicators* from Cell-Phone Sample Household and Provider Data Collection by Survey Year, National Immunization Survey - Child, 2011-2017†

Survey Year	Resolution Rate (%)	Screener Completion Rate (%)	Interview Completion Rate (%)	CASRO Response Rate (%)	Children with Adequate Provider Data (%)
2011	47.0	76.2	70.4	25.2	66.7
2012	52.4	77.5	75.5	30.6	63.9
2013	53.8	79.3	71.6	30.5	59.8
2014	58.7	78.5	72.6	33.5	58.9
2015	56.3	79.3	72.2	32.2	55.5
2016	54.0	83.9	70.9	32.1	54.0
2017	43.0	83.7	69.5	25.0	53.6

*For the definition of the key indicators see Table 1 of NIS-Child Data User's Guide for the survey year of interest.

† Excludes U.S. territories.

Figure G.2: Trends in Cell-Phone Sample Key Indicators from Household and Provider Data Collection by Survey Year, National Immunization Survey - Child, 2011-2017*



* Excludes U.S. territories.

Figure G.2 provides a graphical representation of the data contained in Table G.2. It shows how selected cell-phone sample key indicators from the household and provider data collection performed from 2011 to present. We observe that the rates since the inception of the cell-phone sample have been essentially flat, aside from a declining percentage of children with adequate provider data, a moderate increase in the resolution rate in 2014 that is likely due to the introduction of a process for removing and classifying as non-working cell-phone numbers flagged as having no recent activity, and a decline in the resolution rate in 2017 when this process was discontinued.

The response rate is the number of households with a completed household interview divided by the estimated number of eligible households in the sample. Within each sample type (landline or cell phone), the number of eligible households was estimated using the CASRO assumptions; these assumptions are that the rate of households among the unresolved telephone numbers is the same as the observed rate of households among the resolved telephone numbers, and the rate of eligible households among unscreened households is the same as the observed rate of eligible households among screened households. Under these assumptions, within each sample type the CASRO response rate is equal to the product of the resolution rate, the screener completion rate, and the interview completion rate. For the combined samples, we have defined the CASRO response rate as the total number of households with a completed interview divided by the estimated total number of eligible households across both sample types, where the estimated total number of eligible households is equal to the sum of the estimated number of eligible households in the landline sample (using CASRO assumptions) and the estimated number of eligible households in the cell-phone sample (using CASRO assumptions). Table G.3 presents the CASRO response rate calculated in this way for the combined landline and cell-phone samples, by survey year, and Figure G.3 presents a graphical representation. Because the CASRO response rate is lower for the cell-phone sample than for the landline sample, the CASRO response rate for the combined landline and cell-phone samples was lower in years with a larger cell-phone sample and higher in years with a smaller cell-phone sample.

Table G.3: CASRO Response Rate for the Combined Landline and Cell-Phone Samples by Survey Year, National Immunization Survey - Child, 2011-2017*

Survey Year†	CASRO Response Rate (%)
2011	52.2
2012	41.2
2013	34.4
2014	42.5
2015	34.9
2016	33.9
2017	26.1

* Excludes U.S. territories.

† Cell-phone sample was added to the NIS-Child in 2011.

2017	83.2	92.7	91.5	91.8	91.4	91.0	82.4	81.7	80.9

* Excludes U.S. territories.

† Prior to 2011, estimates are single-frame, landline-sample estimates. From 2011 onward, estimates are dual-frame (landline plus cell-phone) estimates.

§ Beginning in 2009, the number of doses required to be up-to-date on Hib depends on the manufacturer of the vaccine. However, the figures shown here refer to 3 or more doses of Hib vaccine regardless of manufacturer.

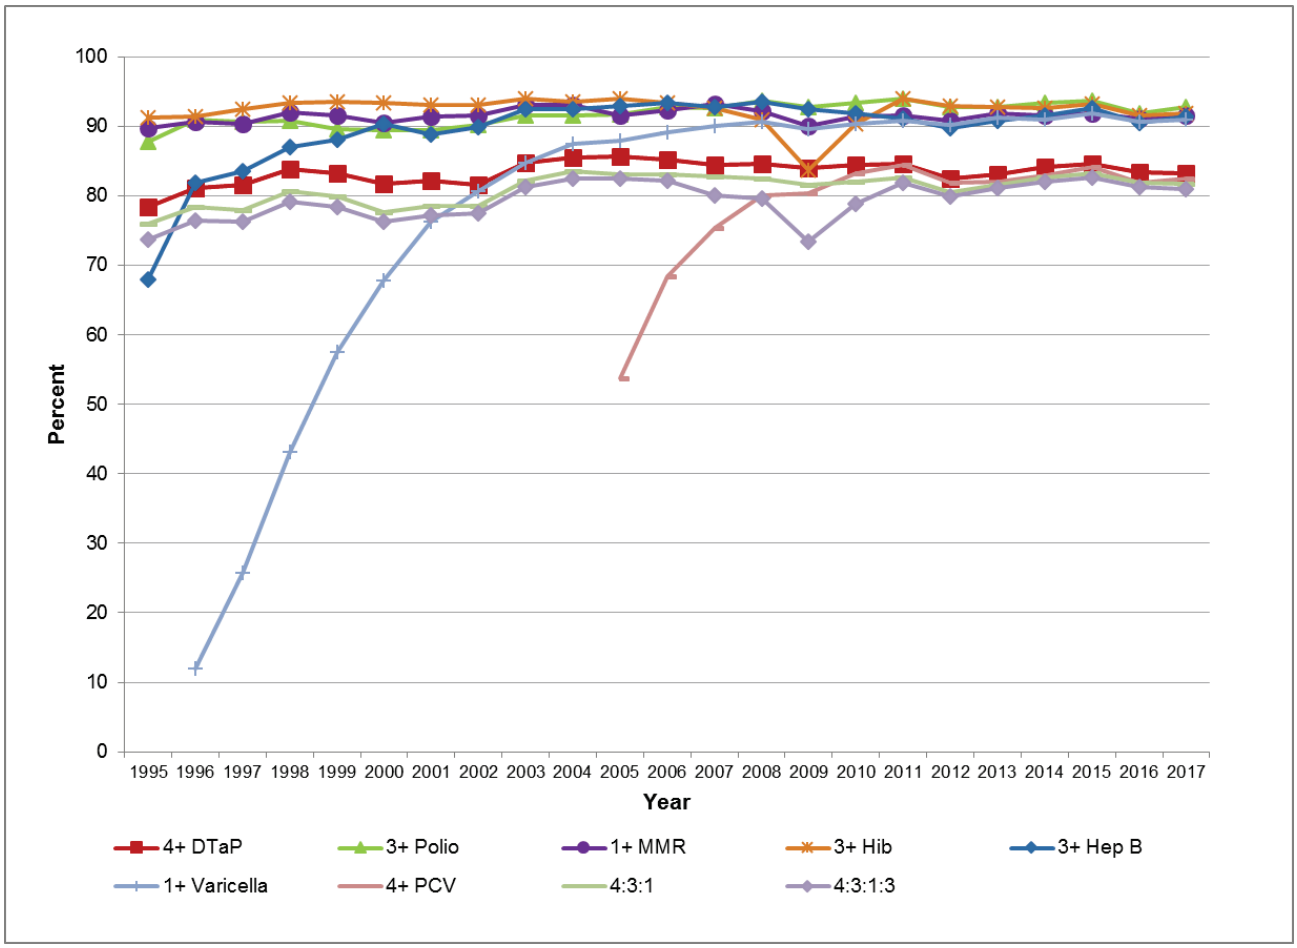
¶ Varicella was added to the NIS-Child in 1996.

** Four or more doses of DTaP, three or more doses of poliovirus vaccine, and one or more doses of MCV.

†† Four or more doses of DTaP, three or more does of poliovirus vaccine, one or more doses of MCV, and three or more doses of Hib.

§§ Revised definition of adequate provider data (APD) implemented.

Figure G.4: Trends in Vaccine-Specific Coverage Levels among Children 19-35 Months of Age in the United States by Survey Year, National Immunization Survey - Child, 1995-2017*†¶



* Excludes U.S. territories.

† Prior to 2011, estimates are single-frame, landline-sample estimates. From 2011 onward, estimates are dual-frame (landline plus cell-phone) estimates.

¶ Revised definition of adequate provider data (APD) implemented in 2012.

Figure G.4 provides a graphical representation of the data contained in Table G.4. It displays the trend in vaccine-specific coverage levels among children aged 19 through 35 months from 1995 to present. We observe that the trend in the vaccination coverage levels is slightly upward for the longer-established vaccines through 2015, while the early trends for new vaccines are strongly upward. Vaccination coverage estimates declined slightly in 2016 and have since remained stable. Note that this chart reflects the landline sample prior to 2011 and the dual-frame sample thereafter. For more

information on interpreting trends in vaccination coverage, see online reports at https://www.cdc.gov/vaccines/imz-managers/coverage/childvaxview/pubs-presentations/NIS-vax-trends-2012-2016.html.

Appendix H: Vaccine Type Codes

Table H.1: 2017 NIS-Child Vaccine Type Codes

Vaccine Code	Description
03	DTaP/DTP/DT-containing, unknown type
04	DTaP/DTP/DT
07	DTaP-Hib
08	DTaP-HepB-IPV
20	OPV
21	IPV
22	Polio-containing, unknown type
30	Measles-mumps-rubella
31	Measles only
32	Measles-mumps
33	Measles-rubella
43	HepB-Hib
44	Hib-only, unknown type
60	HepB-only
70	Pneumococcal conjugate, unknown type
71	Pneumococcal polysaccharide
72	Pneumococcal-containing, unknown type
73	Pneumococcal conjugate-7
74	Pneumococcal conjugate-13
D3	DTaP-IPV-Hib
FL	Seasonal influenza, unknown type
FM	Seasonal influenza spray
FN	Injected seasonal influenza
HB	HepB-containing, unknown type
HG	Hib-only (GSK)
HI	Hib-containing, unknown type
HM	Hib-only (Merck)
HS	Hib-only (Sanofi)
HY	Hib-MenCY
MM	Measles-containing, unknown type
RG	Rotarix (GSK)
RM	Rotateq (Merck)
RO	Rotavirus-containing, unknown type
VA	Varicella-containing, unknown type
VM	MMR-varicella
VO	Varicella-only
